CODE: 00ZERA610VSME

ELECTRONIC CASH REGISTER

MODEL ER-A610

SRV Key : LKGIM7113RCZZ
 PRINTER: M-820
 (For "V" version)

CAUTION

EXTREME CAUTION MUST BE TAKEN WHEN SERVICING THIS MACHINE. EVEN THOUGH THE MODE SWITCH IS IN THE \odot POSITION, VOLTAGE IS STILL SUPPLIED TO THE ENTIRE MACHINE.

WHEN WORKING ON THIS MACHINE MAKE SURE THAT THE POWER CORD IS REMOVED FROM THE WALL OUTLET.

CONTENTS

CHAPTER 1. SPECIFICATIONS	1

PARTS GUIDE

Parts marked with "▲" is important for maintaining the safety of the set. Be sure to replace these parts with specified ones for maintaining the safety and performance of the set.

CHAPTER 1. SPECIFICATIONS

1. Appearance/Rating

1) Appearance

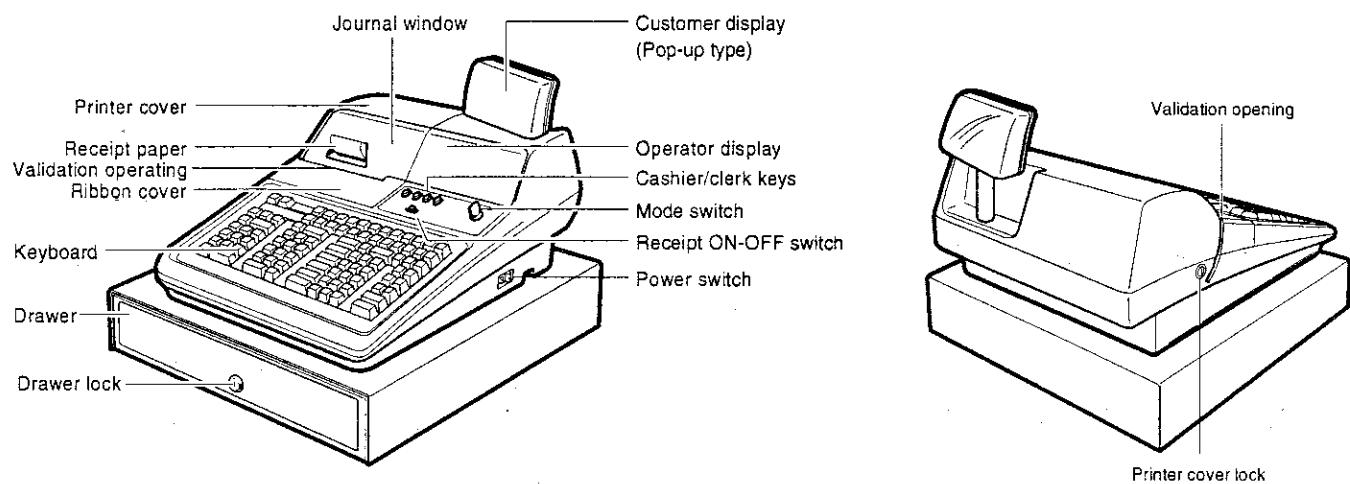

Fig. 1-1

Fig. 1-2

2) Rating

Power source	AC local voltage ($\pm 10\%$) 50Hz/60Hz
Power consumption	Standby: 20 W Maximum: 60 W(Germany), 61 W(U.K.), with options installed.
Operating temperature	0°C~40°C (32°F~104°F)
Operating humidity	10%~90% (RH)
Physical dimensions, including the drawer	445(W) × 485(D) × 325(H)mm
Weight	18 kg

2. Keyboard

1) Standard keyboard layout

RECEIPT	JOURNAL						13	14	15	16	17	18	19	20	21	22	23	24	
SLIT	VP	RCPT						1	2	3	4	5	6	7	8	9	10	11	12
NS	CUSTOMER		AMT	PLU/SUB			EAN			REPEAT	PRICE CHANGE			INQ	DELETE	NON-DELETE			
#	VAT	VAT SHIFT	⊗	*	CL		5	10	15	20					AUTO	CHARGE			
RA	%1	%2	7	8	9		4	9	14	19					CR1	CR2			
PO	⊖1	⊖2	4	5	6		3	8	13	18					EX1	CH			
RF	∞		1	2	3		2	7	12	17					ST				
			0	00			1	6	11	16					TL				

Fig. 2-1

2) Key top name

① Standard key top

Keytop	Description
0 to 9, .00	Numeric keys
.	Decimal point key
C L	Clear key
⊗	Multiplication key
DEPT. 1~20	Department 1~20 keys
↑ RECEIPT	Receipt paper feed key
↑ JOURNAL	Journal paper feed key
RCPT	Receipt print key
VP	Validation print key
#	Non-add code entry key
AUTO	Automatically entry key
NS	No sale key
VAT	Value added tax key
SLIP	Slip print key
GC COPY	Guest check copy key
⊖ 1	Discount 1 key
⊖ 2	Discount 2 key
% 1	% 1 key
% 2	% 2 key
PO	Paid out key
RA	Received on account key
RF	Refund key
Ä	Void key
AMT	Amount key
PLU/SUB	PLU/Subdept. code entry key
EX1	Currency Exchange 1 keys
PLU 1~24	Direct/Sub department 1~24 keys
ST	Tax included subtotal key
CR 1	Credit 1 key
CR 2	Credit 2 key
CH	Check key
TL	Total key
VAT SHIFT	VAT Shift key
CUSTOMER	Customer code entry key
EAN	EAN code entry key
REPEAT	Repeat key
INQ	EAN inquiry key
PRICE CHANGE	Price change key
DELETE	Delete key
NON DELETE	Non-delete key
CHARGE	Charge key

② Option key top

Keytop	Description
DEPT. 21~99	Department 21~99 keys
PLU 24~126	Direct/Sab department 24~126 keys
⊖ 3, 4	Discount 3 and 4 keys
% 3, 4	%3 and 4 keys
CR3~8	Credit 3~8 keys
CA 2	Cash 2 key
EX 2~9	Currency Exchang 2~9 keys
AUTO 2 ~10	Automatically entry key 2~10
1/2	1/2 key
CH2 ~ CH4	Check2 ~ 4 keys
CLK1 ~ CLK10	Push button clerk1 ~ 10 keys
2nd PRICE	Second price entry key
000	000 key
RA2	Received account 2 key
PO2	Paid out 2 key
DEPT#	Department number entry key
CHK PR	Check print key
SCALE	Scale key
DIFF ST	Differ subtotal key

3. Mode switch

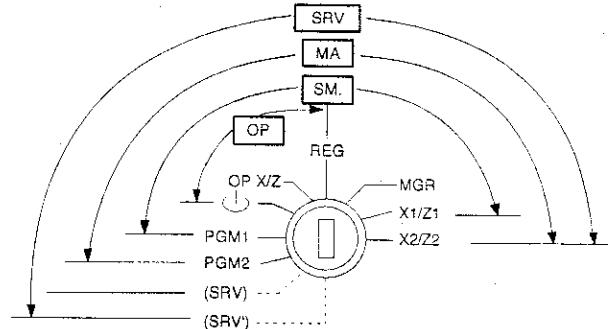

Fig. 3-1

- * The key can be removed in the REG or OFF position.
- * In the SRV' mode, key inputs are prohibited and no display is made.
- * With the key in the off position power is still supplied to the main PWB.

[Functions]

- Function for each key position
- SRV': System reset
- SRV: Service mode (Service programming)
- PGM2: Allows programming of an item that is not changed frequently, in addition to the PGM1 mode programming.

- PGM1: Allows programming of items frequently changed (e.g. department, PLU pricing, and discount rate setting).
- OP/XZ: Allows X or Z operation by servers or cashiers.
- REG: Allows registrations.
- MGR: Allows the operations, by authorized person such as a manager (e.g. correction after transaction finished or cancellation of entry limits), which are not permitted to ordinary cashiers.
- X1/Z1: Allows reading and resetting of a day's sales total.
- X2/Z2: Allows reading or resetting sales totals in a specified period.
- ⓧ: Switching off the display to prevent key board entries.
(The setting does not turn off the AC power.)

4. Display

1) Layout

① Operator display

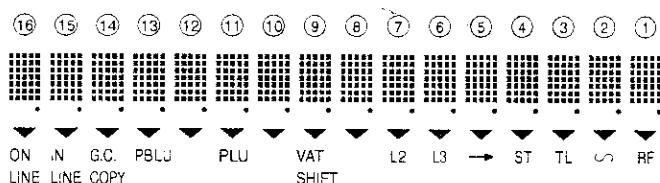

Fig. 4-1

Dot display	
No. of positions	16
Color of display	Green
Character size	8.15 (H) × 5.75 (W) mm
Font	Dot matrix (5×7)

② Customer display

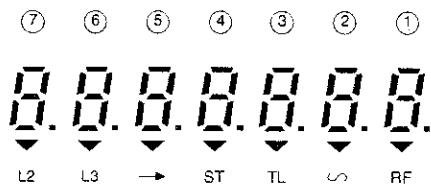

Fig. 4-2

No. of positions	7
Color of display	Green
Character size	13(H) × 6(W) mm
Font	7 segments

Lamps

Display contents	Description
ON LINE	The lamp lights up when the machine is connected to the online transmission line; and it goes off when the machine is disconnected from the line. The lamp blinks during data transmission.
IN LINE	The lamp lights up during inline communications.
G. C. COPY	The lamp is on while the machine is in the GUEST CHECK COPY mode.
GLU	The lamp lights up when a NC (New check) or PBLU key depressed, and it goes off when a transaction operation is finalized.
PLU	The lamp lights up when a PLU entry is made.
VAT SHIFT	The lamp lights up when the VAT SHIFT key is pressed.
2nd PRICE	The lamp lights up when the 2nd PRICE key is pressed.
L2	The lamp lights up when the PLU level is 2.
L3	The lamp lights up when the PLU level is 3.
→	The lamp lights up when the change due is displayed after an amount tendered entry.
ST	The lamp lights up when a subtotal is displayed.
TL	The lamp lights up when a transaction is finalized with CASH, CHECK, CREDIT, or CHARGE key, however, the lamp does not light up when a transaction is finalized with an amount tendered entry.
VOID	The lamp lights up when a void key entry is made.
RF	The lamp lights up when a RF key entry is made.

5. Printer (M-820)

1) Specifications

- | | |
|----------------------------|---|
| • Part number: | M-820 |
| • No. of stations: | 2 |
| • Printing system: | Mechanical serial dot |
| • Direction of printing: | Bidirectional |
| • Printing capacity: | Receipt – 21 characters
Journal – 21 characters
Validation – 47 characters
(one line only) |
| • Character size: | 2.7 (H) X 1.5 (W) mm
Print pitch:
Column distance 1.83 mm
Row distance 4.3 mm |
| • Total number of dots: | (95 dots per line) X 2 (receipt and journal)
Validation Max 213 dot |
| • Font: | 7 X 7 dots
Space between characters – 1 dot |
| • Distance between dots: | 0.4 mm (H) X 0.407 mm (W) |
| • Journal near end sensor: | Service route option |
| • Auto cutter: | Set up (Full and partial cut.) |
| • Print speed: | Approx. 2.5 lines/sec. (Approx. 26.4V) |
| • Paper feed speed: | Receipt – Approx. 28.2 lines/sec.
Journal – Approx. 11.2 lines/sec. |
| • Reliability: | MCFB – 2 million lines (excluding the print head)
Head life – 40 million characters
(in the case of printing average 2 dots per character per wire) |
| • Validation form sensor: | Not setup |

2) Printing area

Receipt/journal

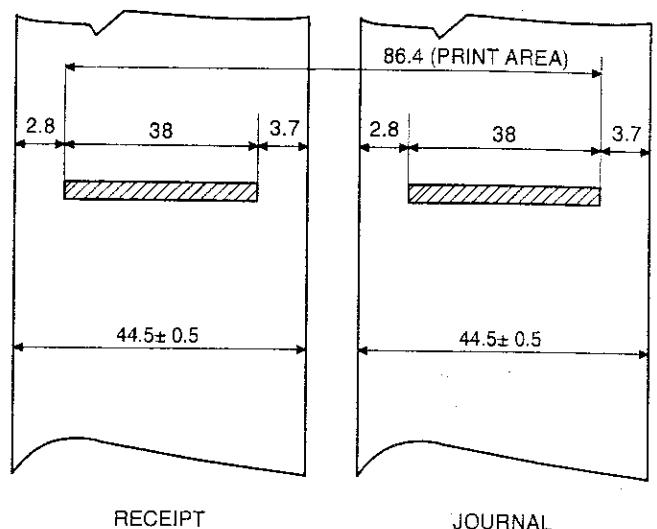

Fig. 5-1

Validation form

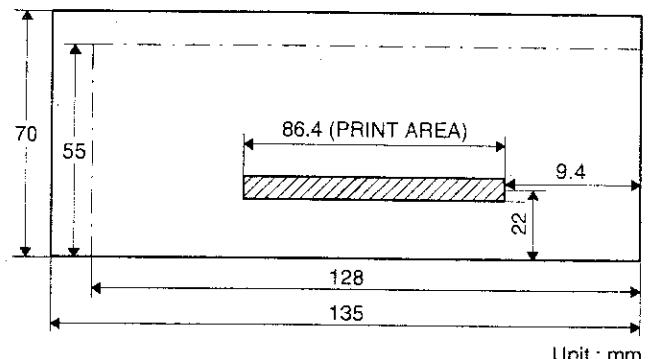

Fig. 5-2

3) Paper

- Paper roll dimensions: 44.5 ± 0.5 mm in width, 80mm in diameter
 - Paper quality:
Journal
Bond paper (paper thickness: 0.06 to 0.09mm, paper weight: 52.3 to 64g/m²)

Validation form
Thickness: 0.07 to 0.14mm
Size: 135mm or more (W) X
70mm or more (H)

4) Inking

- Ink supply system: Ink ribbon
 - Form: Cartridge
 - Specification: Material – Nylon
 - Ribbon life: 6 million characters
 - Print color: Purple (single color)

5) Logo stamp

- Material: Porous rubber
 - Stamp color: Purple (single color)
 - Max. stamp size: 30(W) × 20(H) mm
 - Ink refill: Allowed (UINK-1001CCZZ: 5CC)

CHAPTER 2. OPTIONS

1. System configuration

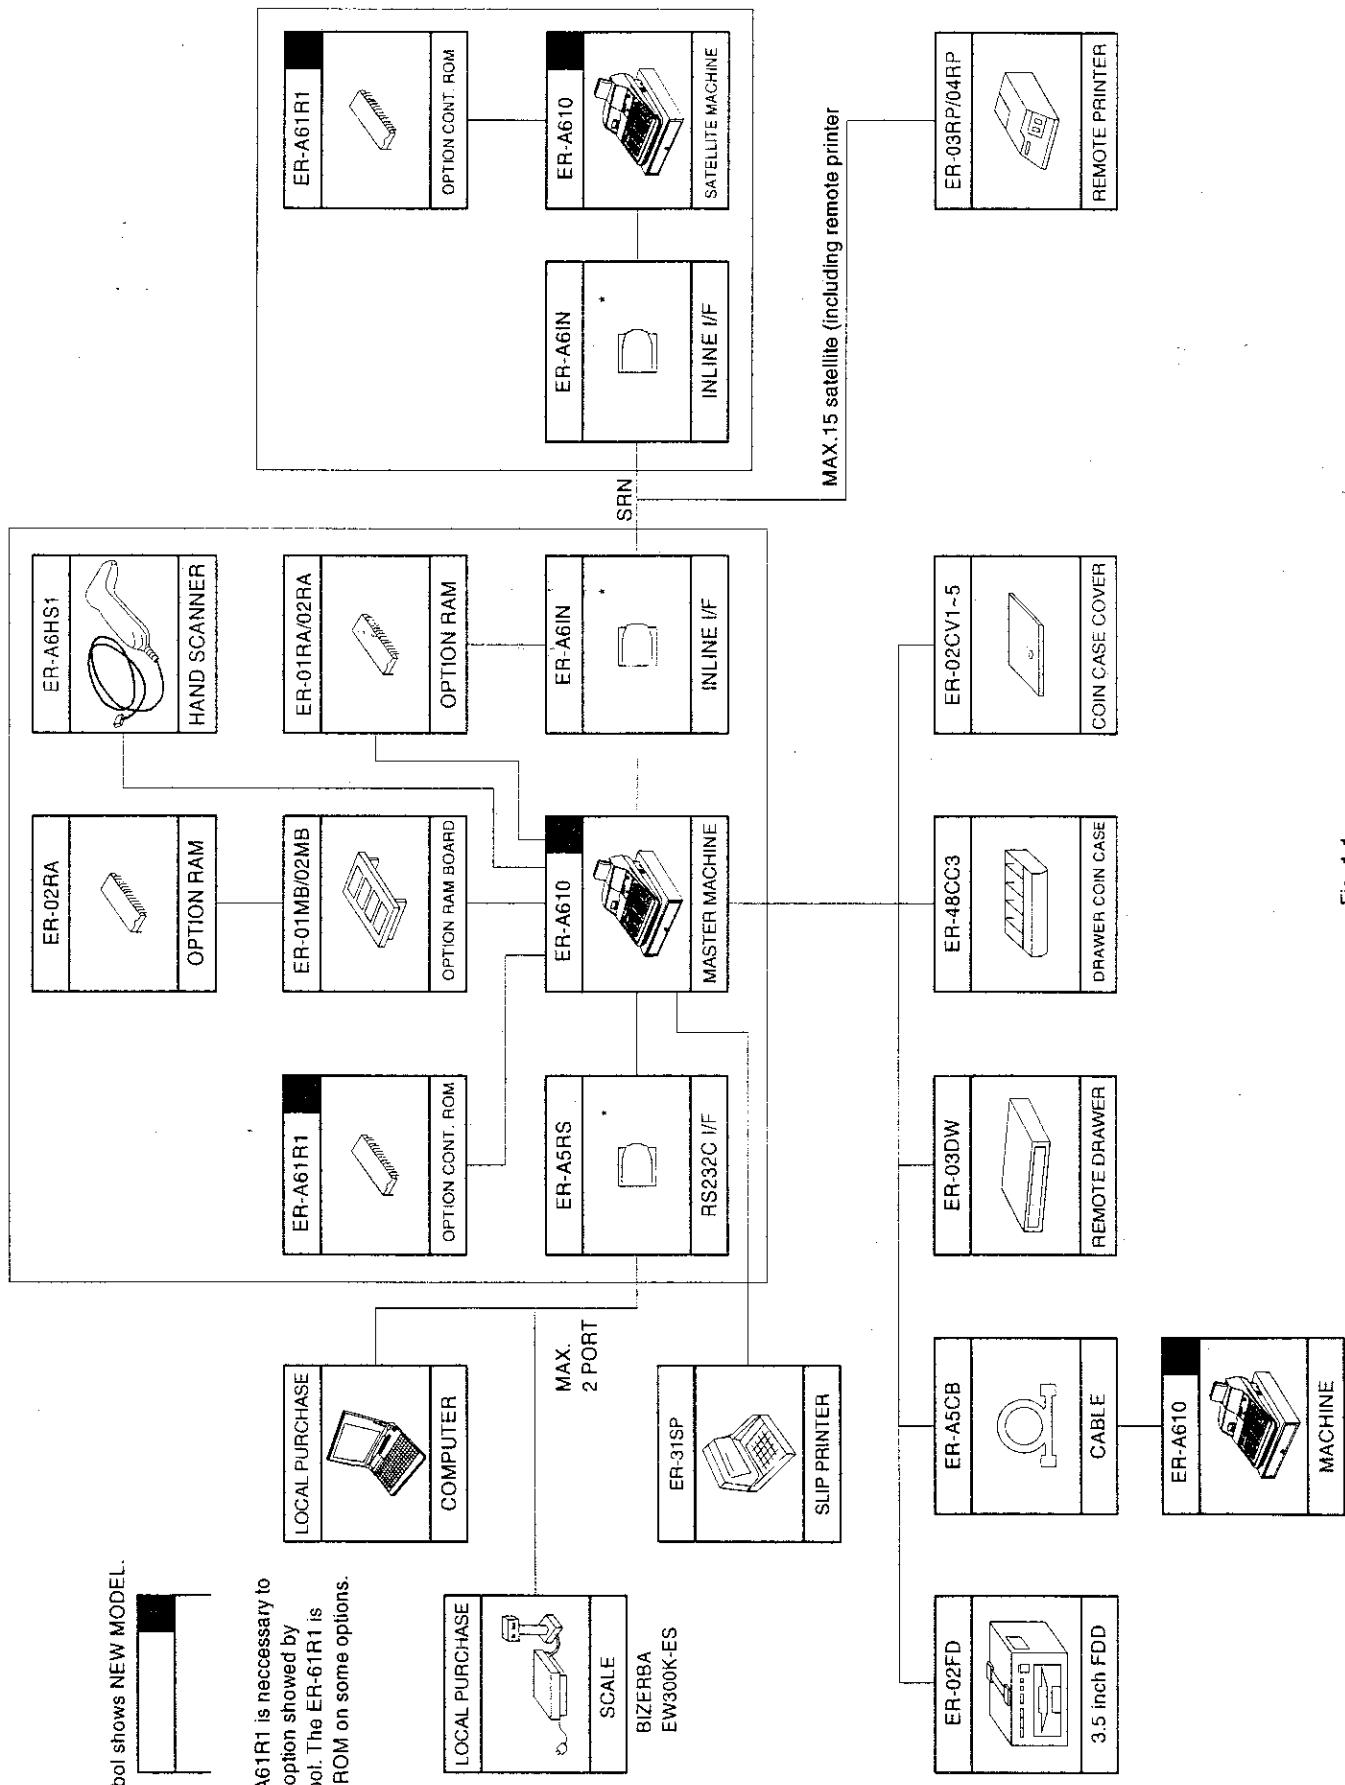

Fig. 1-1

2. Options

NO	NAME	MODEL	DESCRIPTION
1	REMOTE PRINTER	ER-03RP	Via SRN I/F (ER-A6IN)
		ER-04RP	
2	HAND SCANNER	ER-A6HS1	
3	REMOTE DRAWER	ER-03DW	4B/8C, MAX. 3 units
4	COIN CASE	ER-48CC3	4B/8C
5	COIN CASE COVER	ER-02CV1~5	For ER-48CC3
6	EXPANSION RAM CHIP	ER-01RA	32K bytes RAM chip
		ER-02RA	128K bytes RAM chip
7	EXPANSION MEMORY BOARD	ER-01MB	128K bytes memory board with 3 IC sockets (For ER-02RA)
		ER-02MB	1M bytes memory board
8	IN-LINE SYSTEM	ER-A6IN	SRN inline I/F
9	ON-LINE SYSTEM	ER-A5RS	2ports RS-232 I/F
10	CONTROL ROM	ER-A61R1	Control for ER-A6IN, ER-A5RS
11	PRESETS LOADER	ER-02FD	FD unit
12	CONNECTION CABLE	ER-A5CB	Loader cable
13	SLIP PRINTER	ER-31SP	
14	KEY TOP KIT	ER-11KT6	1×1 key top
		ER-12KT6	1×2 key top
		ER-22KT6	2×2 key top
		ER-11DK6	1×1 dummy key
		ER-51DK6	1×5 dummy key

3. Service options

NO.	NAME	PARTS CODE	PRICE RANK	DESCRIPTION
1	SERVICE KEY	LKGIM7113RCZZ	AK	For the mode switch
2	DRIP-PROOF SWITCH COVER	GCOVB7047RCZZ	BA	
3	MODE KEY GRIP COVER	LKGIM7126RCZZ	AL	OP key only
4	DRIP-PROOF KEYBOARD COVER	GCOVB7043RCZZ	BC	
5	JOURNAL NEAR END SENSOR	DKIT-8643RCZZ	BG	
6	DRAWER FIXING KIT	DKIT-8633RCZZ	BE	
7	PROGRAMMING CHARACTER KEYBOARD COVER	GCOVB7043RCSC	BG	

4. Service tools

NO.	NAME	PARTS CODE	PRICE RANK
1	EXPANSION PWB	CKOG-6708RCZZ	BU
2	SIO LOOP BACK CONECTOR	UKOG-6704RCZZ	AV
3	RS-232 LOOP BACK CONNECTOR	UKOG-6705RCZZ	BU

5. Supplies

NO.	NAME	PARTS CODE	PRICE RANK	DESCRIPTION
1	ROLL PAPER	DPAPR1006CSZZ	AR	5rolls/pack
2	INK RIBBON	PRBN-6640RCZZ	AX	
3	INK FOR STAMP	UINK-1001CCZZ	AK	5cc

6. Options

For installation of the options, refer to the Installation Manual which is separately issued from this manual.

7. How to use service tools

7-1. SIO loop back connector: UKOG-6704RCZZ

- External view

Signal	Pin	
GND	1	N.C
ER	2	
DR	3	
RXD	4	
TXD	5	
CD	6	
RR	7	
CS	8	
RS	9	

Fig. 7-1

- Purpose: Used for "SIO Test 1 (SIO loop back test)."
- Installation view:

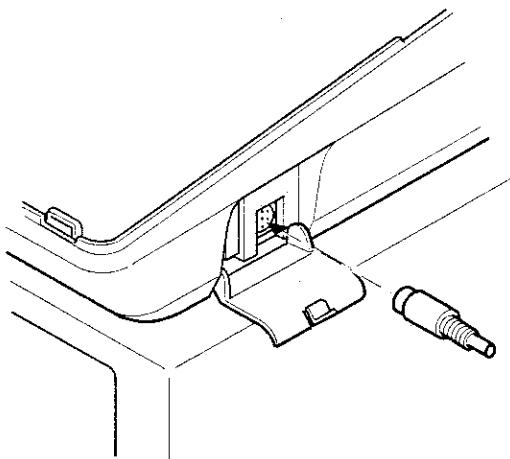

Fig. 7-2

- How to use: Connect the UKOG-6704RCZZ to the body and perform the following key operations:
SRV mode: 117 →

7-2. Expansion PWB: CKOG-6708RCZZ

- External view

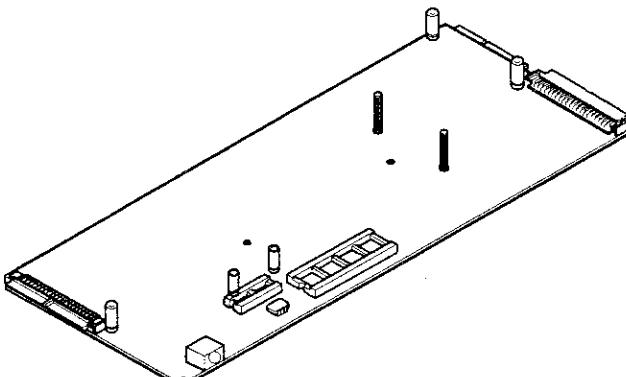

Fig. 7-3

Purpose 1: Used for servicing and repairing of options (such as the ER-A6IN and the ER-A5RS) which are connected with the main body option connector.

[Procedure 1]

Use an insulator base as that in Fig. 7-4 (shaded section) and perform servicing.

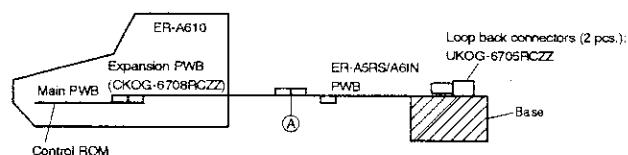

Fig. 7-4

To check the option I/F PWB from the solder side, connect the I/F PWB to OPTCN2. To check from the parts side, connect to OPTCN3.

(Note) The option I/F PWB should be held horizontally so that no excessive stress is applied to connecting section A in Fig. 7-4.

[Procedure 2]

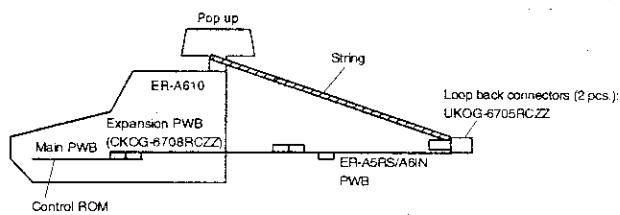

Fig. 7-5

As shown in Fig. 7-5, put a string between the pop up and the option PWB angle and adjust the length of the string so that the CKOG-6708RCZZ and the option PWB. Then perform servicing.

Purpose 2: The CKOG-6708RCZZ is equipped with the loop back connector for checking the ER-A5CB (SIO cable) cable operations.

Example of use

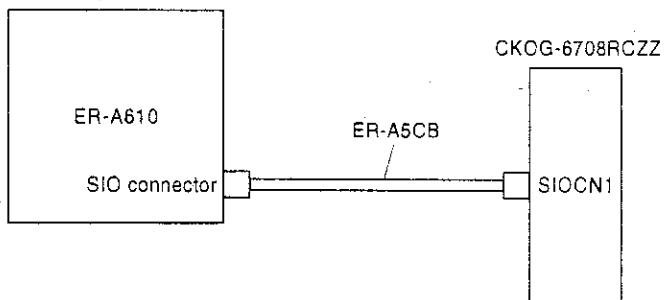

Fig. 7-6

Checking procedure

- Connect the ER-A5CB between an ECR body and the CKOG-6708RCZZ SIOCN1. (The SIO functions of the ECR must be normal.)
- Perform test function "117 (SIO loop back test)" and judge it normal or abnormal.

CHAPTER 3. SRV. RESET AND MASTER RESET

1. SRV. reset (Program Loop Reset)

Used to return the machine back to its operational state after a lock-up has occurred.

Procedure

- Method 1
 - 1) Turn off the AC switch.
 - 2) Set the mode switch to (SRV') position.
 - 3) Turn on the AC switch.
 - 4) Turn to (SRV) position from (SRV') position.

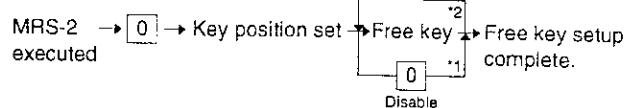

- Method 2

- 1) Set the mode switch to PGM2 position.
- 2) Turn off the AC switch.
- 3) While holding down JOURNAL FEED key and RECEIPT FEED key, Turn on the AC switch.

Note: When disassembling and reassembling always power up using method 1 only. Method 2 will not reset the CKDC4.

Note: SRV programming job#926-B must be set to "4" to allow PGM program loop reset.

[key setup procedure]

NOTES:

- *1: When the 0 key is pressed, the key of the key number on display is disabled.
- *2: Push the key on the position to be assigned. With this, the key of the key number on display is assigned to that key position.
- *3: When relocating the keyboard, the PGM 1/2 use standard key layout.

Key number	Key name	Key number	Key name
1	Numeric key "0"	9	Numeric key "8"
2	Numeric key "1"	10	Numeric key "9"
3	Numeric key "2"	11	Numeric key "00"
4	Numeric key "3"	12	Decimal point key
5	Numeric key "4"	13	CL key
6	Numeric key "5"	14	⊗ key
7	Numeric key "6"	15	ST key
8	Numeric key "7"	16	TL key

2. Master reset (All memory clear)

There are two possible methods to perform a master reset.

- MRS-1

Used to clear all memory contents and return machine back to its initial settings. return keyboard back to default. for default keyboard layout.

Procedure

- 1) Turn off the AC switch.
- 2) Set the MODE switch to the (SRV') position.
- 3) Turn on the AC switch.
- 4) While holding down JOURNAL FEED key, turn to (SRV) position from (SRV') position.

- MRS-2

Used to clear all memory and keyboard contents.

This reset returns all programming back to defaults. The keyboard must be entered by hand.

This reset is used if an application needs different keyboard layout other than that supplied by a normal MRS-1.

Procedure

- 1) Turn off the AC switch.
- 2) Set the MODE switch to the (SRV') position.
- 3) Turn on the AC switch.
- 4) While holding down JOURNAL FEED key and RECEIPT FEED key, turn to (SRV) position from (SRV') position.

5) Key position assignment:

* After the execution of MRS-2, only the RECEIPT FEED and JOURNAL FEED keys can remain effective on key assignment. Any key can be assigned on any key position on the main keyboard.

2-3. CKDC4 (HD404728A20FS)

1) General description

The CKDC4 is a 4-bit microcomputer developed for the ER-A670 and provides functions to control the real-time clock, keys, and displays. The basic functions of the CKDC4 are shown below.

Keys: The CKDC4 is capable of controlling a maximum of 256 momentary keys. (Sharp 2-key rollover control)
Simultaneous scanning of key and switch
(When a key is scanned, the state of a mode and clerk switch is also buffered. The host can scan the state of switch together with the key entry data at the same time the key is scanned.)

Switches: Mode switch with 14 positions maximum
8-bit clerk (cashier) switch
2-bit feed switch
1-bit receipt on/off switch
1-bit option switch
4-bit general-purpose switch (1-bit is used for keyboard select)

Displays: 16-column dot display
12-column 7-segment display (column digit selectable)
All column blink controlled for the dot and 7-segment display decimal point and indicators
Programmable patterns for 7-segment display:
Four patterns
Internal driver for 7-segment display

Buzzer: Single tone control

Clock: Year, month, day of month, day of week, hour, minute

Alarm: Hour, minute

Interrupt request (event control):

Detection of key input, switch position change, alarm issue, and counter overflow

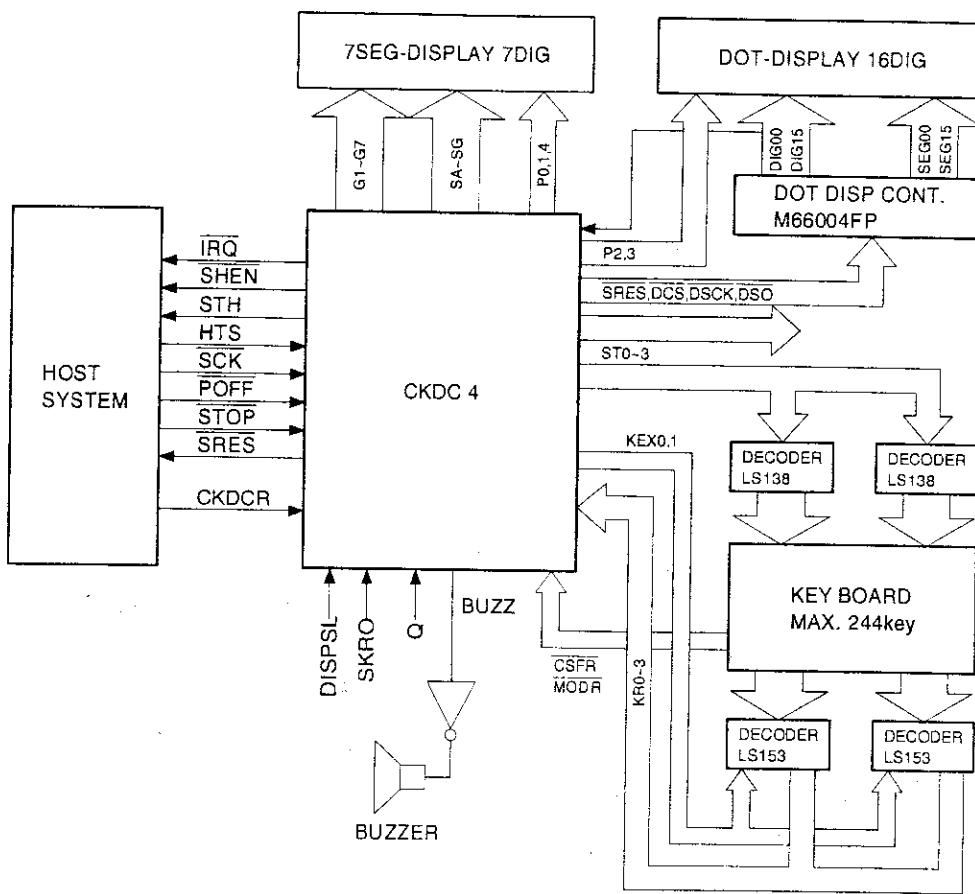

Fig. 2-5

NOTE 3: Pull-up/down in the table indicates that the lines concerned require external pull-up/down resistance.

3. Clock generator

1) CPU (HD6415108FX)

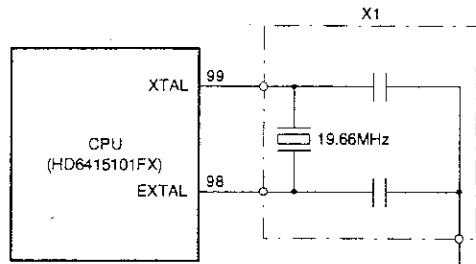

Fig. 3-1

Basic clock is supplied from a 19.66MHz ceramic oscillator. The CPU contains an oscillation circuit from which the basic clock is internally driven. If the CPU was not operating properly, the signal does not appear on this line in most cases.

2) HD404728A20FS CKDC-III oscillation circuit (Display-PWB)

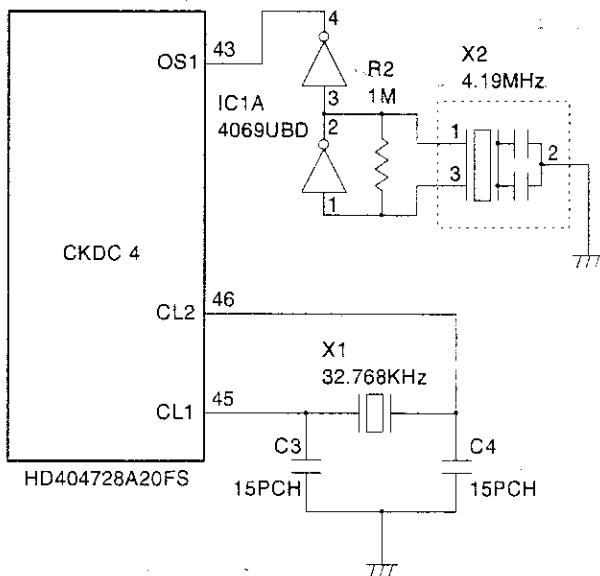

Fig. 3-2

Two oscillators are connected to the CKDC4. The main clock X2 generates 4.19MHz which is used during power on. When power is turned off, the CKDC4 goes into the standby mode and the main clock stops. The sub-clock X1 generates 32.768KHz which is primarily used to update the internal RTC (real time clock). During the standby mode, it keeps oscillating to update the clock and monitoring the power recovery.

4. Reset (POFF) circuit

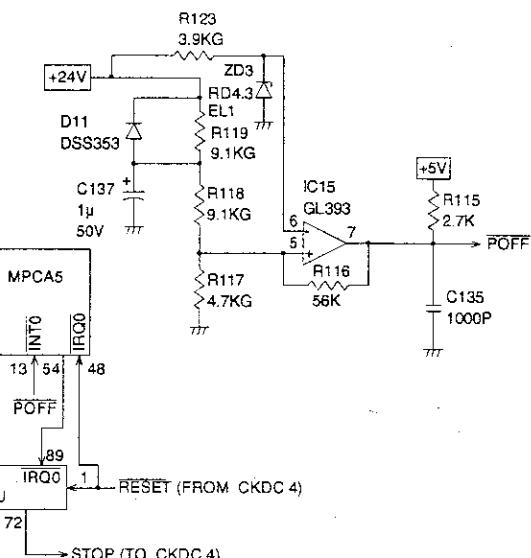

Fig. 4-1

In order to prevent memory loss at a time of power off and power supply failure of the ECR, the power supply condition is monitored at all times. When a power failure is met, the CPU suspends the execution of the current program and immediately executes the power-off program to save the data in the CPU registers in the external S-RAM with the signal \overline{STOP} forced low to prepare for the power-off situation. The signal \overline{STOP} is supplied to the CKDC4 as signal \overline{RESET} to reset the devices.

This circuit monitors +24V supply voltage.

The voltage at the (-) pin of the comparator GL393 is always maintained to 4.3V by means of the zener diode ZD3, while +24V supply voltage is divided through the resistors R119, R118, and R117, and is applied to the (+) pin. When normal +24V is in supply, 5.1V is supplied to the (+) pin, therefore, signal \overline{POFF} is at a high level. When +24V supply voltage decreases due to a power off or any other reason, the voltage at the (+) pin also decreases. When +24V supply voltage drops, the voltage at the (+) pin drops below +4.3V, which causes \overline{POFF} to go low, thus predicting the power-off situation.

5. Memory control

1) Memory map

① All range memory map

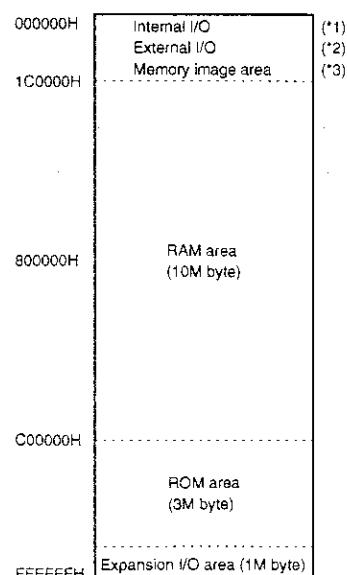

Fig. 5-1

- (*1) "Internal I/O" means the registers in the H8/510.
- (*2) "External I/O" means the base system I/O area to be addressed in page 0.
- (*3) "Memory image area" means the lower 32KB of ROM area which is projected to 000000H ~ 007FFFH for allowing reset start and other vector addressing, or the lower 32KB of ROM area which is projected to 008000H ~ 00FE7FH for allowing 0 page addressing of work RAM area.
- (*4) "Expansion I/O" means expansion I/O device area which is addressed to area other than page 0.

② 0 page memory map

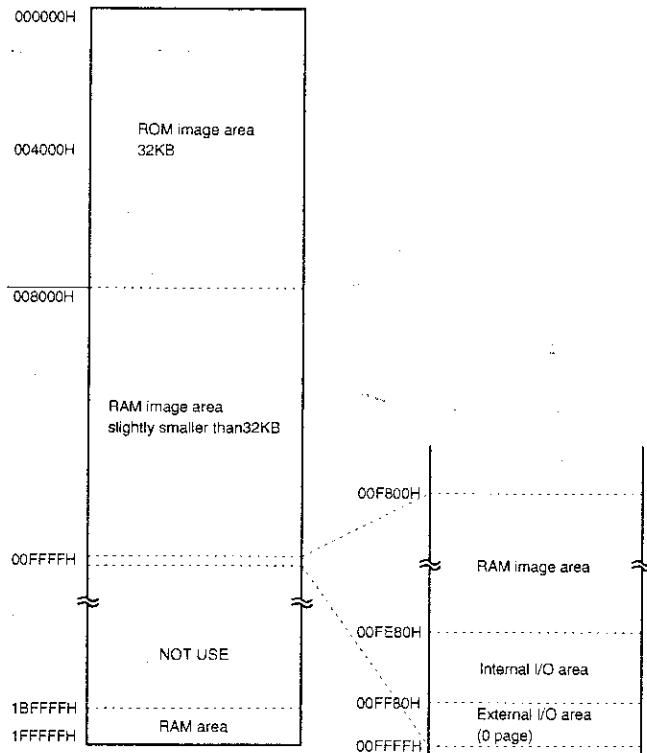

Fig. 5-2

- ROM image area: Image is formed in ROM area address C00000H ~ C07FFFH. This area is identical to IPL ROM area which will be separately developed.
- RAM image area: Image is formed in RAM area address 1D8000H ~ 1DFE7FH. (*Note)
- * Note: Image can be formed in lower 32KB of RAS2.

③ ROM area memory map

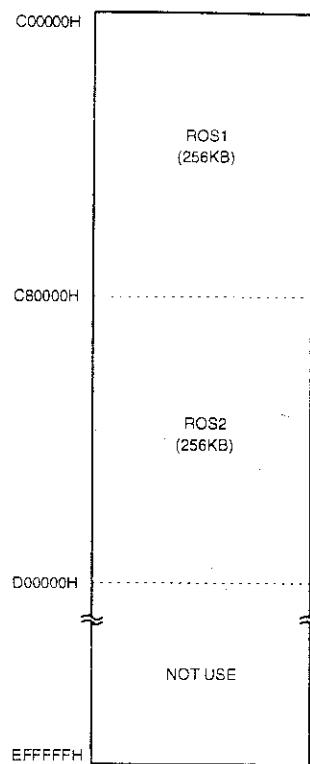

Fig. 5-3

These two decode signals decode 512KB space respectively and can be used with max. 4MB ROM.

* Note: The lower 32KB of ROS1 signal is formed as OR of image area in 0page.

④ RAM area memory map

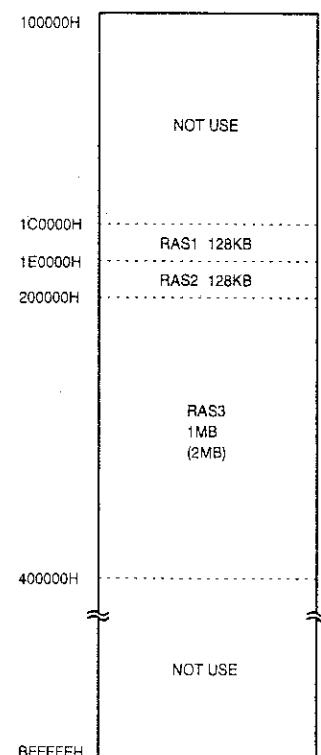

Fig. 5-4

In the three RAM chip select, the following address is decoded.

CS signal Address

- RAS1 1C0000H-1DFFFFH
(008000H-00FE7FH) * Note
- RAS2 1E0000H-1FFFFFFH
(008000H-00FE7FH) * Note
- RAS3 200000H-3FFFFFFH

* Base signal is for 2M.

* Note: RAS1 signal is formed as OR in the image area of 0 page. (Lower 32KB).

RAS2 signal is formed as OR in the image area of 0 page. (lower32KB).

(5) I/O area memory map

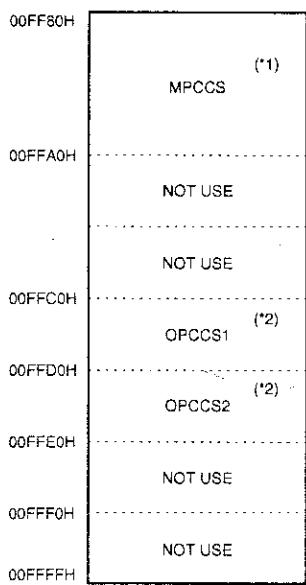

Fig. 5-5

* Note 1: MPCCS signal is the base signal for MPCA5 internal register decoding, and does not exist as an internal signal.

* Note 2: OPCCS1 and OPCCS2 signals are decoded in the OPC (option peripheral controller) using the base signal OPTCS for option decoding. They do not exist as external signals.

2) Block diagram

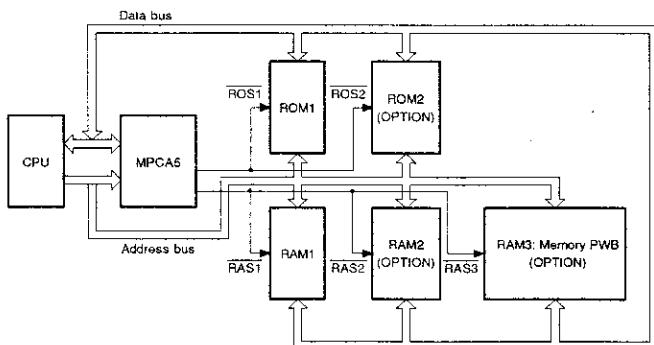

Fig. 5-6

① ROM control

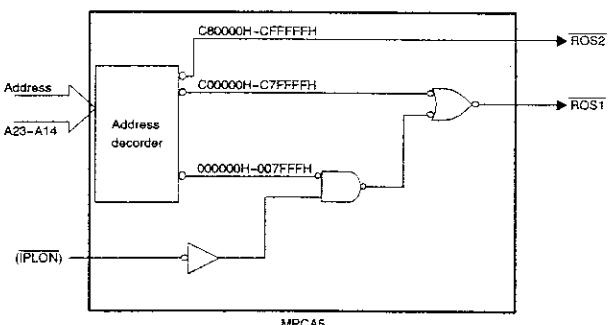

Fig. 5-7

IPLON: IPL board detection signal incorporated in the option slot.
Note used in the ER-A650. (Not used)

Access is performed with two ROM chip select signals ROST and ROS2, which decode 512KB address area respectively to access max. 4MB ROM.

② RAM control

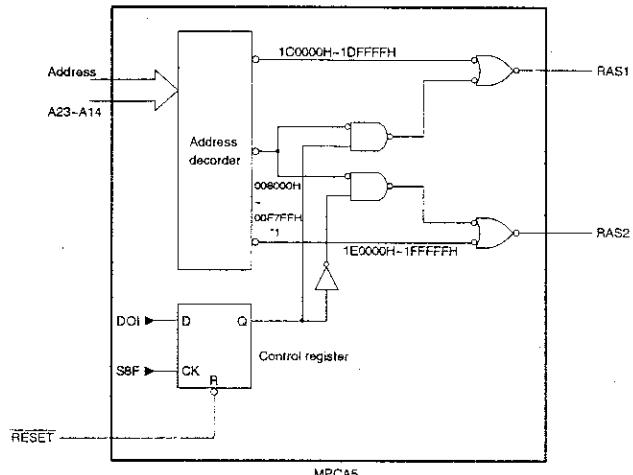

Fig. 5-8

Access is performed with two RAM chip select signals RAS1, RAS2 and RAS3. The control register in MPCA5 allows selection of page image memory area. (RAS1 is selected for initializing.)

* : For 0 page image area, selection between RAS1 and RAS2 can be made with the control register. The 0 page control register performs initializing at the timing of no stack process immediately after resetting.

6. SSP circuit

1) Block diagram

This is the circuit employed to do the Special Service Preset (SSP).
(Block diagram)

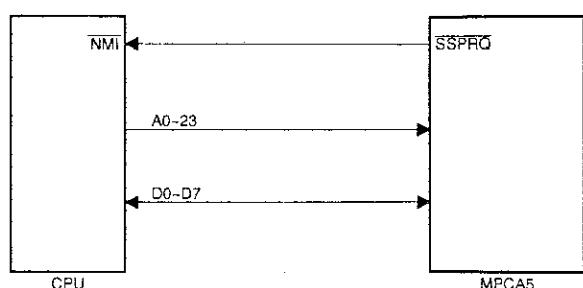

Fig. 6-1

(MPCA5 block diagram)

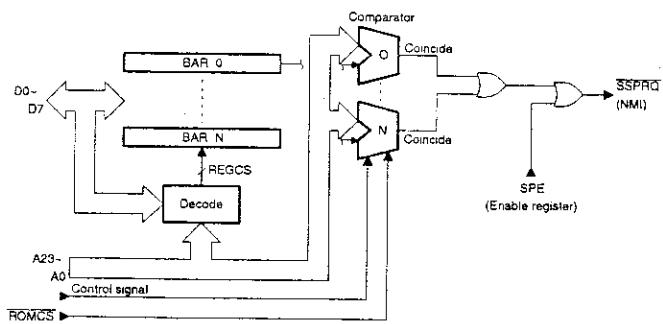

Fig. 6-2

As the address detection system, the brake address register comparison system is employed though the mapping system was employed in the conventional monitor RAM. The address register located in MPCA is always compared with the system address bus to monitor and generate NMI signal at a synchronized timing and to go to NMI exception process.

In the exception process routine service routine, the entry address is checked to go to SSP sub routine.

Entry to the break address register (BAR) is performed through address FFFF00H or later decoded in MPCA5.

2) SSP register

The break address register (BAR) is accessed through direct address of FFFF00H~FFFFFFH. Entry number is 32 entry.

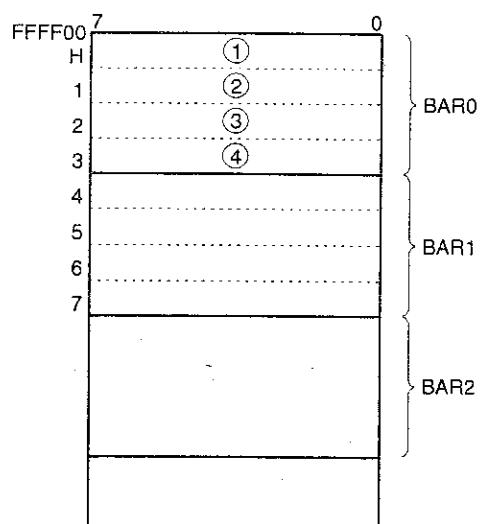

Fig. 6-3

Each BAR is composed of 4 byte address. Bit composition is as follows:

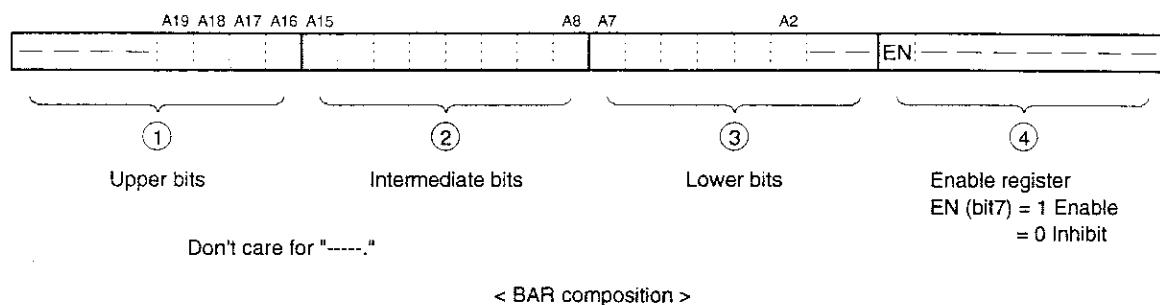

Fig. 6-4

④ is the enable register. The entry registers of the break address are assigned to ①, ②, and ③. Each bit of address corresponds to each bit position, writing to ①, ②, and ③ is performed without shifting. The corresponding area is 1MB space of ROS1 and ROS2.

3) SSP register access method

Access to SSP break address register is performed through the temporary register as shown below:

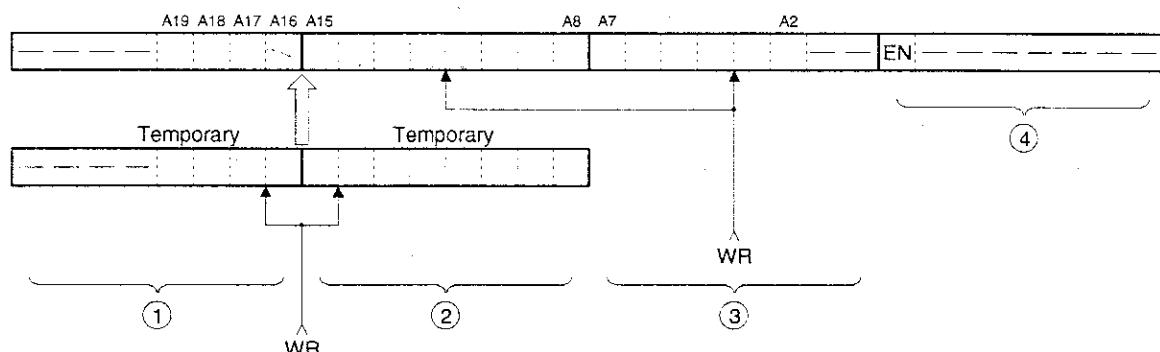

Fig. 6-5

Enable flags can be accessed individually.

Though enable register ④ can be accessed individually, writing to brake address registers ① and ② is performed at the same time as writing to brake address register ③ through the temporary register. Therefore, set ① and ② to temporary, then write into ③ at last. Since the temporary register is commonly used by BAR sets, the following register setting is performed after completion of setting of each break address register.

③ SSP control method

Access to the enable register and the brake address register is only possible when writing to them from the CPU.

bit 7	6	5	4	3	2	1	0	
0	0	0	CMP4	CMP3	CMP2	CMP1	CMP0	(FFFFFFFH)

The brake signals (NMI) and the above detection data (CMP0-4) are held until the above detection data are read. So read should be made in the NMI sub routine. (Clear by FFFFFFFH read.)

* 1: FFFFFFFH is not fulldecoded. (FFFF00H~FFFFFH). Therefore, unnecessary read access in parentheses should not be performed.

Information on which brake register the SSP brake is detected in is read as binary data by reading address FFFFFFFH (*1).

Used in an expanded register.

Normally is a reserve bit. When reading, fixed to 0.

If there are 32 break registers, binary expression is made with the above 5 bits, and 0th is "00000_b" and 31st is "11111_b".

When detected simultaneously by two or more break registers, one with the smaller BAR number is read as binary data.

7. PRINTER control circuit

1) Block diagram

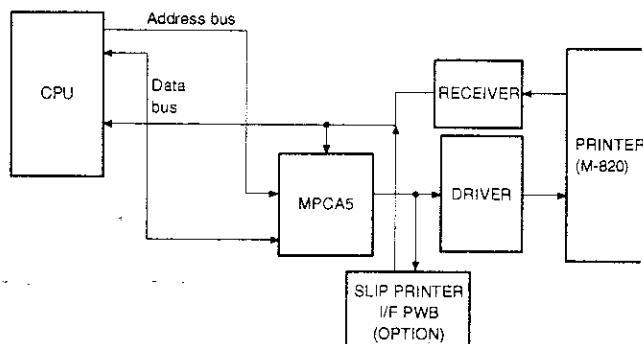

Fig. 7-1

2) General description of the printer controller

The M820 is used as the R/J printer of the body and the M240 is used as the slip printer. The printer mechanical timing control is made by the CPU through MPCAS.

3) Motor drive circuit

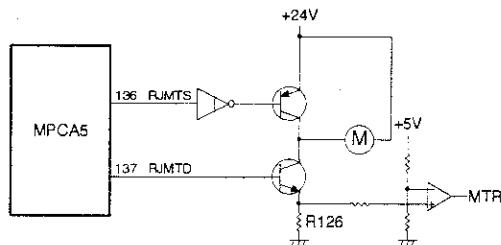

Fig. 7-2

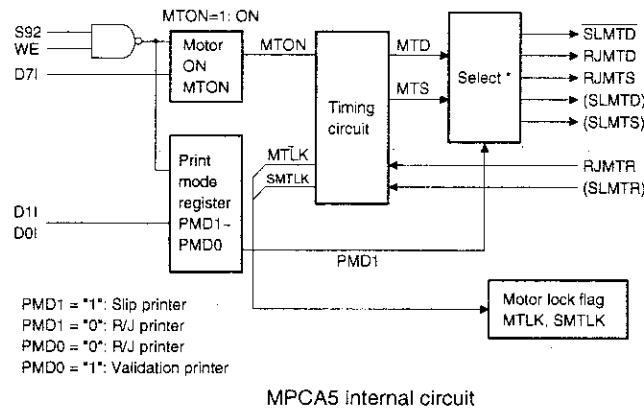

Fig. 7-3

The printer motor ON/OFF control is performed with RJMTO as the drive signal and RJMTS as the brake signal. Motor lock detection is performed as follows:

Check by the hardware: The motor drive current flowing from the MTD transistor is checked across R126. When an overcurrent is detected, the MTR signal becomes HIGH to drive the MTS and MTD signals in the MPCAS to HIGH impedance to stop conduction of the motor.

When the motor is stopped, the CPU timing pulse width is extended and the CPU judges it as motor lock.

CPU motor lock detection can be read out as internal register MTLK. Lock can be released by writing dummy data into MTLK as well as by conventional hardware reset.

Check by the CPU: When timing pulse from the printer is not generated for more than the specified time, the CPU judges it as motor lock, the MTON is reset (To High) and the motor is stopped.

4) Printhead mechanism

With the timing plus (TS) from the motor, current is applied to the dot wire drive coil to print.

- Discussion is given here to explain how a single dot wire is driven.
 - ① When current is applied to a coil, the actuator moves towards the arrowhead (a) as the steel core is magnetized. The actuator makes connection with the wire, and the wire pushed out towards the platen.
 - ② As the wire hits the platen with the ink ribbon and paper in-between, a dot is then printed.
 - ③ When current is removed from the coil, the actuator and the wire return to their home positions by means of the actuator spring and wire return spring.

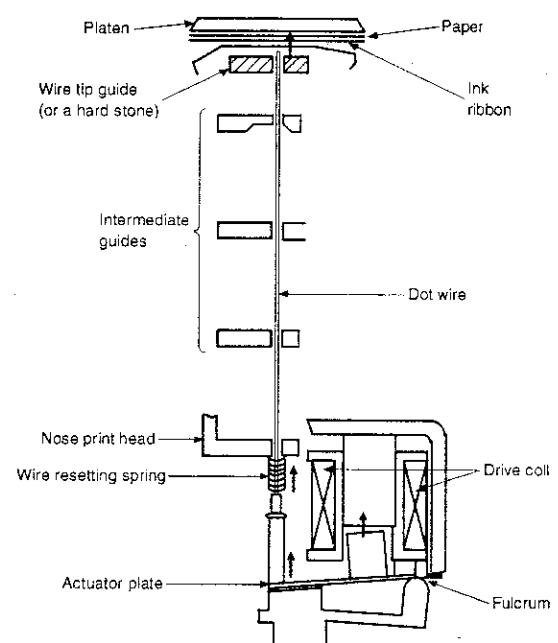

Fig. 7-4

5) Dot wire drive control circuit

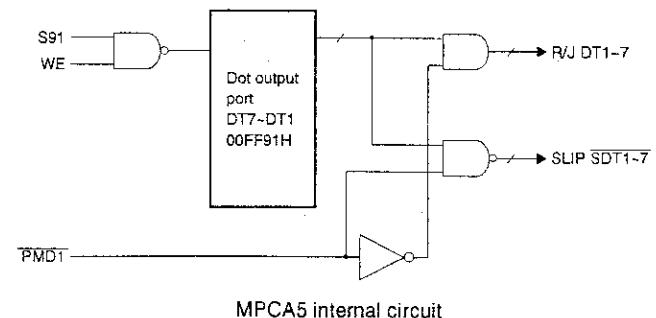

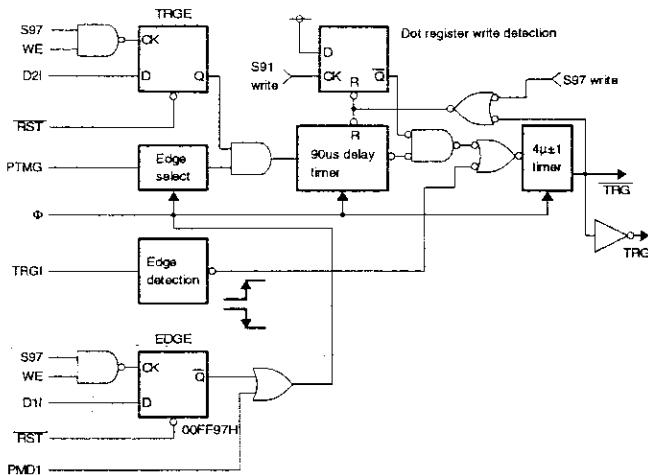

Fig. 7-5

When writing is made into address 00FF91H by the dot register in MPCAS, dot wire drive signals DT1~DT7 are formed.

When PMD1 is low, the R/J printer is selected.

6) Print trigger generating circuit

MPCA5 internal circuit
Fig. 7-6

1) Automatic trigger mode selection register (TRGE)

- TRGE = 1: Automatic trigger generation
 TRGE = 0: Trigger is generated at change edge of OCRA matchoutput.
 (Reset initial value = 0)
- Timing pulse active edge select register (EDGE)
 EDGE = 0: Falling edge
 EDGE = 1: Rising edge
 (Reset initial value = 0)

7) Dot solenoid drivers (solenoid 1 - 7)

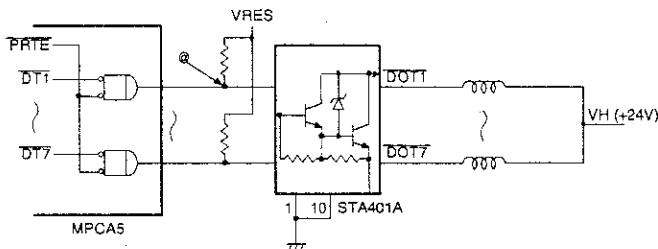

Fig. 7-7

Current to the dot solenoid is controlled in the following manner:

- VRES must be at a high level.
- At the same time DT1 is set low, TRG must be set low.
- PRTE is now set low. (MPCA5)
- PE must be set high level.
- The signal is turned high at point @, the magnet driver output is set low, and then VH flows through the magnet driver.
- The dot wire now protrudes to hit and print.

8) Sensor signal receive circuit

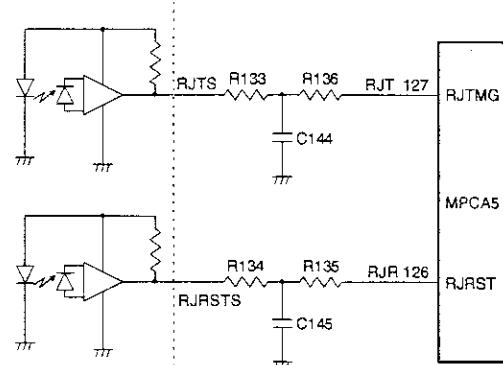

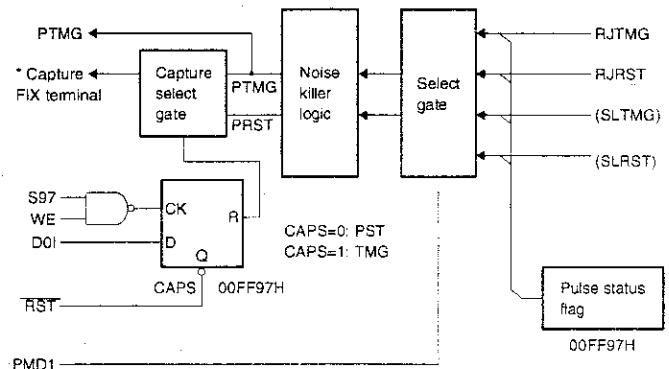

Fig. 7-8
MPCA5 internal circuit

** PRST/PTMG is in the same phase (non-reversion) of RJTMG/RJRST.

Fig. 7-9

The signal from the photocoupler within the printer is converted into TTL level and conveyed to the MPCA5.

9) Paper feed, stamp and cutter circuit

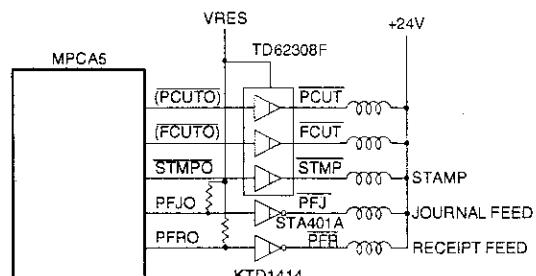

Fig. 7-10

The paper feed/stamp related signals issued from MPCA5 and pulled up by the VRES signal to prevent action when the power supply is not steady.

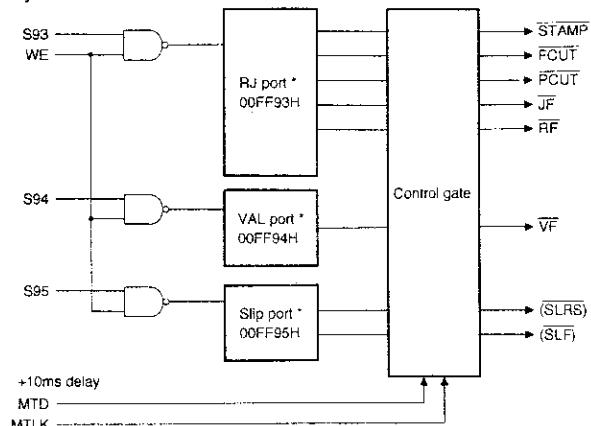

Fig. 7-11

Printer control signals are generated by writing each port address into the register address in PMCA5.

CAUTION

If fuse F2 should be blown, the dot head solenoid may be shorted. Be sure to check the head impedance and driver breakdown.

When fuse F2 is blown:

- ① Remove F2, and perform the service resetting. The set the mode switch to a position other than SRV and SRV' and turn off the power.
- ② Install fuse F2 (1.5A) and turn on the power.
If the fuse blows with the above operation, driver STA401A may be shorted.
- ③ Turn off the power.
- ④ Disconnect the printer cable from the printer. Measure impedance between the printer body connector pin 21 and the following pins: 18, 20, 24, 25, 28, 29, 30
The impedance must be 12.4 ~ 18Ω.
If impedance is outside the above range, the dot solenoid is bad. Replace the dot head unit.

8. Drawer drive circuit

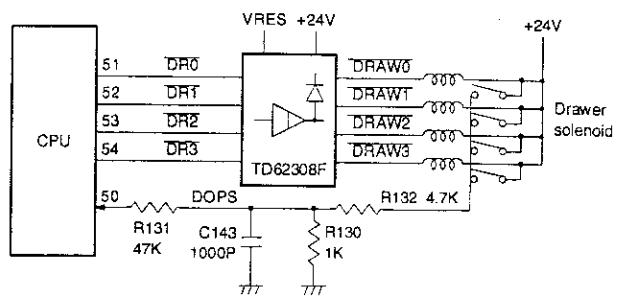

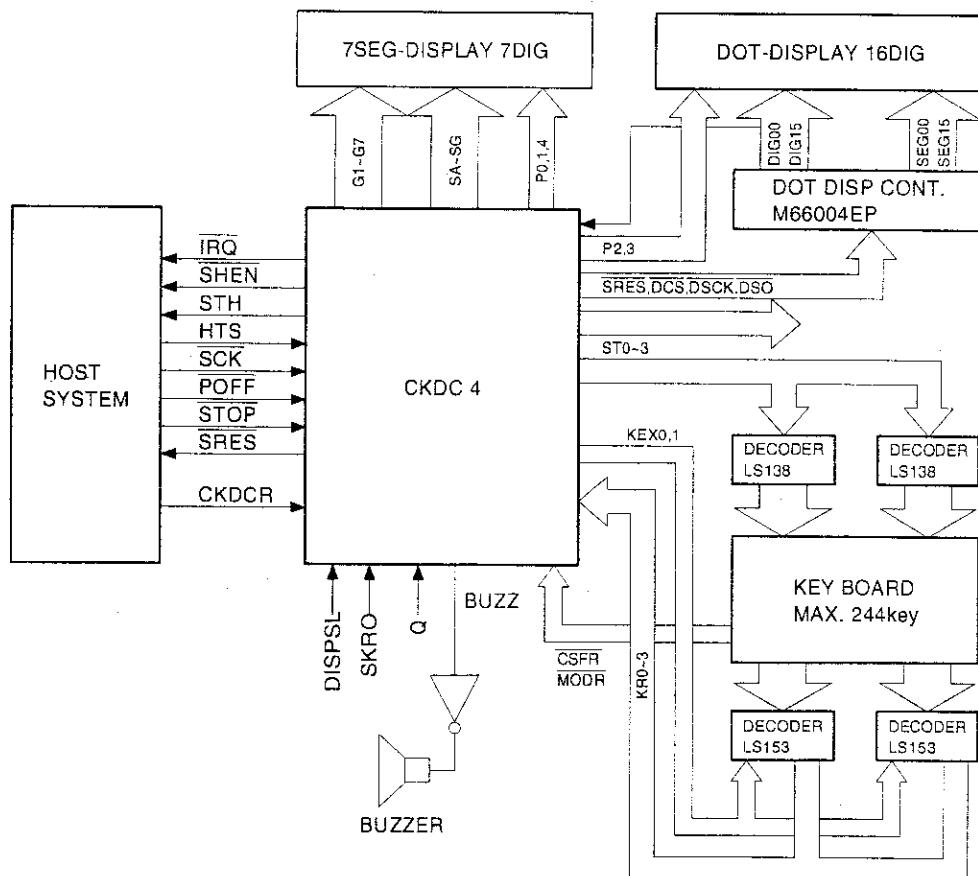

Fig. 8-1

The drawer is directly supported by the CPU. No action starts when the power supply is not steady as the output stage of the driver is pulled VP by VRES signal.

Drawer open and close is sensed with the microswitch provided in the drawer whose signal is level converted with R75 and R77 and directly read by the CPU.

9. Key, display, timer, buzzer controls

The keys, switches, displays, timer/calendar, and buzzer are controlled by the CKDC-4 on the display PWB.

Block diagram
Fig. 9-1

1) Power on/off sequence

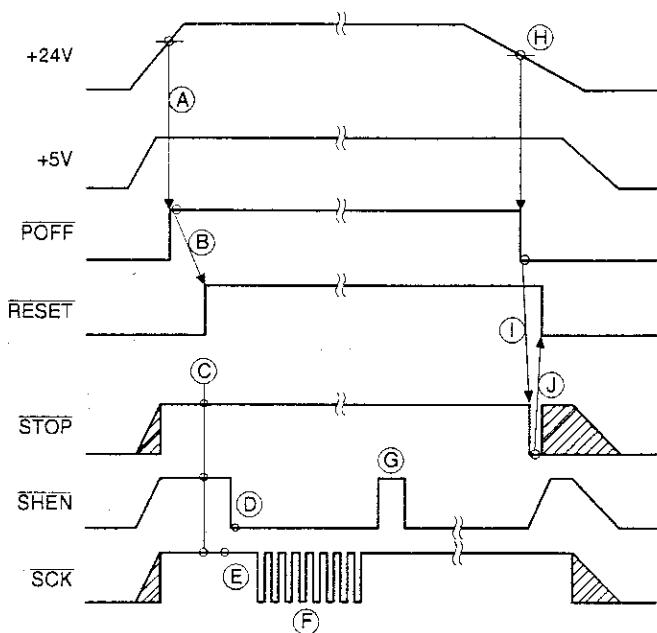

Fig. 9-2

Hatched area indicates logic unstable.

<At power on>

When +24V power rises, the signal POFF is forced high (A), by which time the +5V supply becomes stable. The CKDC-III monitors the state of POFF while updating the timer/calendar in the low power standby mode, and when the high state of POFF is detected, the system reset signal (RESET) is set high (B), by which time the output lines STOP and SCK of the CPU and MPCA5 have been initialized to high, respectively (C). Thereafter, the CKDC-III sets SHEN active (low) (D) to notify the CPU of the command/data communication ready state.

One byte data/command can be transferred with eight SCK pulses (F). When one byte has been transferred with eight SCK pulses, the CKDC-III sets SHEN high to initiate internal processing. After completion of the internal processing, when the next byte transfer becomes ready, the CKDC-III sets SHEN back to a low state to wait for the next byte transfer (G).

Thereafter, the SHEN and SCK timing described above is repeated to carry on the communication.

<At power off>

When +24V power drops, POFF goes low (H).

A low on the POFF line causes a low level interrupt request which is sent to the IRQ0 pin of the CPU. Within a maximum of 10msec of the low level IRQ0 input, the CPU performs software processing necessary for power-off, after which the STOP output is set low (I).

When STOP goes low, the CKDC-III sets RESET low to reset the whole system (J). And, the +5V supply is held at 4.75V or higher voltage, after which the voltage drops to a level that the logic circuit does not operate.

2) Key and switch scanning

Strobes ST0 ~ ST3 are decoded on the keyboard by two 74LS138 3-to-8 decoders to generate 16 strobe signals of S15 ~ S0.

The key matrix consists of 16 strobe lines and 16 returns lines of KR0A, KR1A, KR2A, KR3A, KR0B, KR1B, KR2B, and KR3B.

To minimize interfacing lines between the CKDCIII and the keyboard unit, two multiplexers (74HC153) are used to multiplex signals by the timing controlled with the signals KEX0 and KEX1 which are sent to the CKDCIII on the return lines of KR0 ~ KR3.

Timing ST

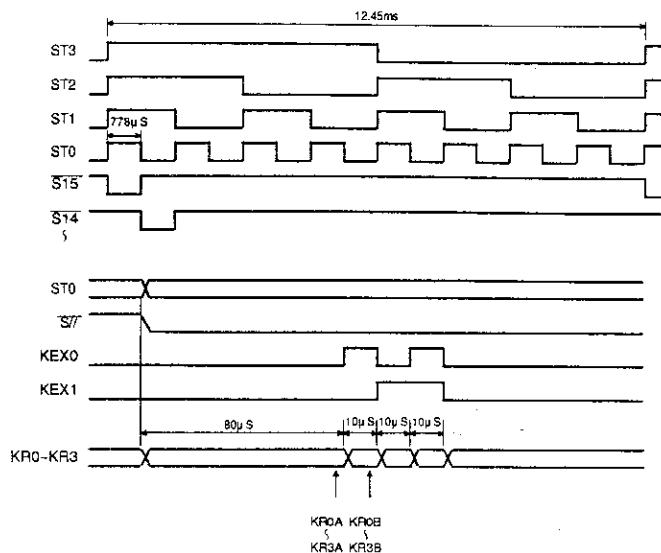

Fig. 9-3

The mode switch is provided with a special return line MODR, apart from the above return lines.

In the same manner, the clerk, paper feed key (J/R), and receipt on/off switches use CFSR as the return line.

3) DISPLAY CONTROL

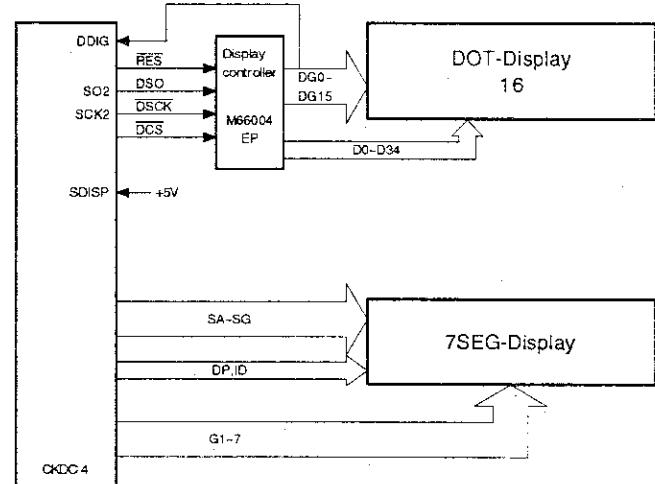

Fig. 9-4

CKDC4 directly drives the 7-segment display unit and the dot display is driven via M66004FP.

<7-segment display>

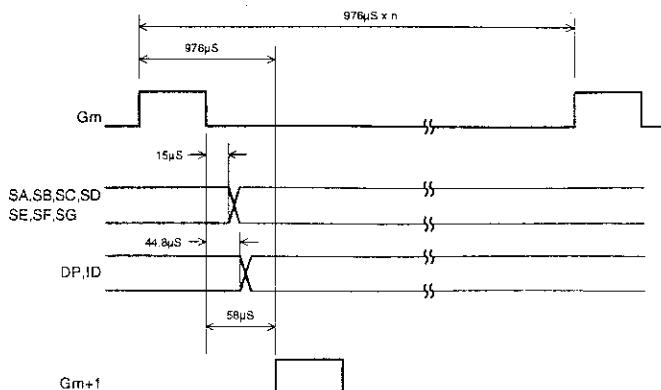

Fig. 9-5

<Dot display>

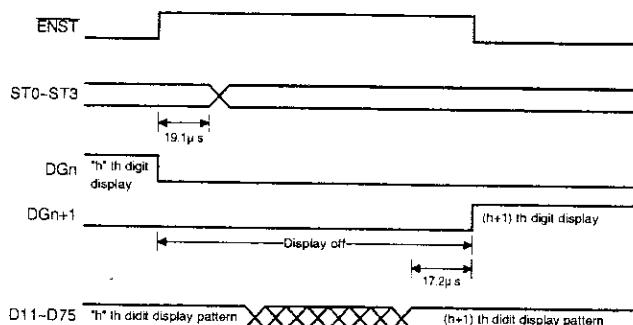

Fig. 9-6

IMPORTANT:

The CKDCIII lines are not high voltage resistive ports. Damage may occur to the CKDC4 if lines are aborted carelessly when using oscilloscope probes.

• Dot matrix tube

A 4-bit binary output signals (ST0-ST3) from CDK4 are converted into the digit drive signal (DG0-DG15) in the M66004FP.

<Dot display control>

The CKDC4 controls the character segment (5 x 7) and the indicator of the dot display by using the controller (M66004FP) for dot display control.

① M66004PF/Dot display control signal

Signal name	Contents	Pin/Remark
DSO	Serial data output signal for M66004FP	C-MOS pin
DSCK	Serial shift clock output signal for M66004FP	C-MOS pin. Requires to be pulled up
DCS	Chip select output signal for M66004FP	C-MOS pin

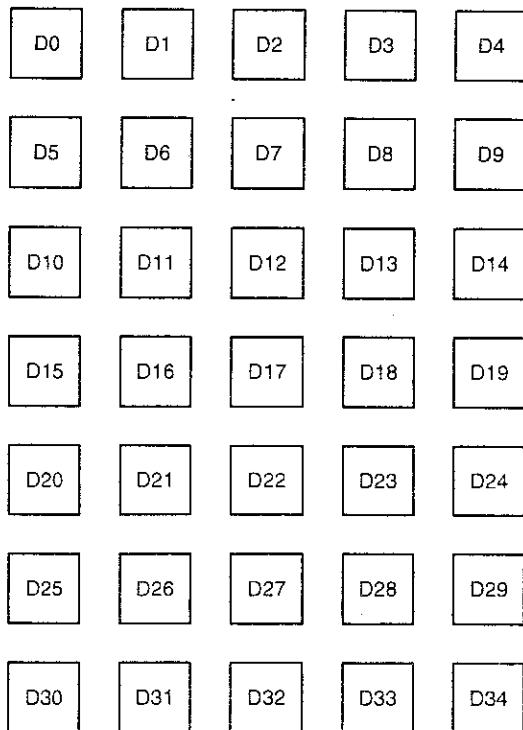

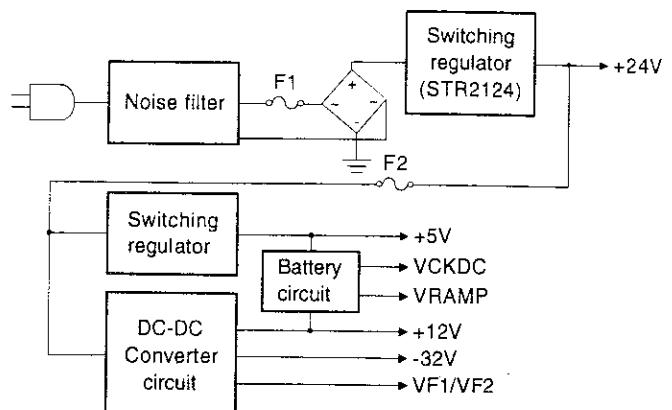

**10. Power supply circuit**

Fig. 10-1

+24V:	Printer, solenoid power
+5V:	VCC (Logic power)
+12V:	Battery charge, IN-LINE driver power
-32V:	Display tube power
VF1, VF2:	Display tube power (AC)
VRAM:	Battery back-up power
VCKDC:	CKDC III Back-up power

For the DC-DC converter, refer to section 8 of cash register Basic manual.

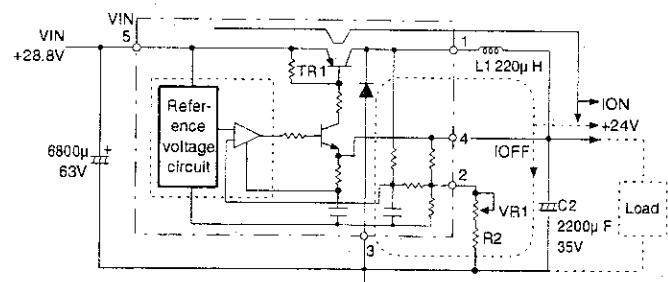

11. Switching regulator circuit

Fig. 11-1

By switching VIN (+28.8V) by the transistor TR1 within the STR2124, DC+24V supply is obtained through the LC network. Stable +24V is obtained by controlling on/off duty of TR1.

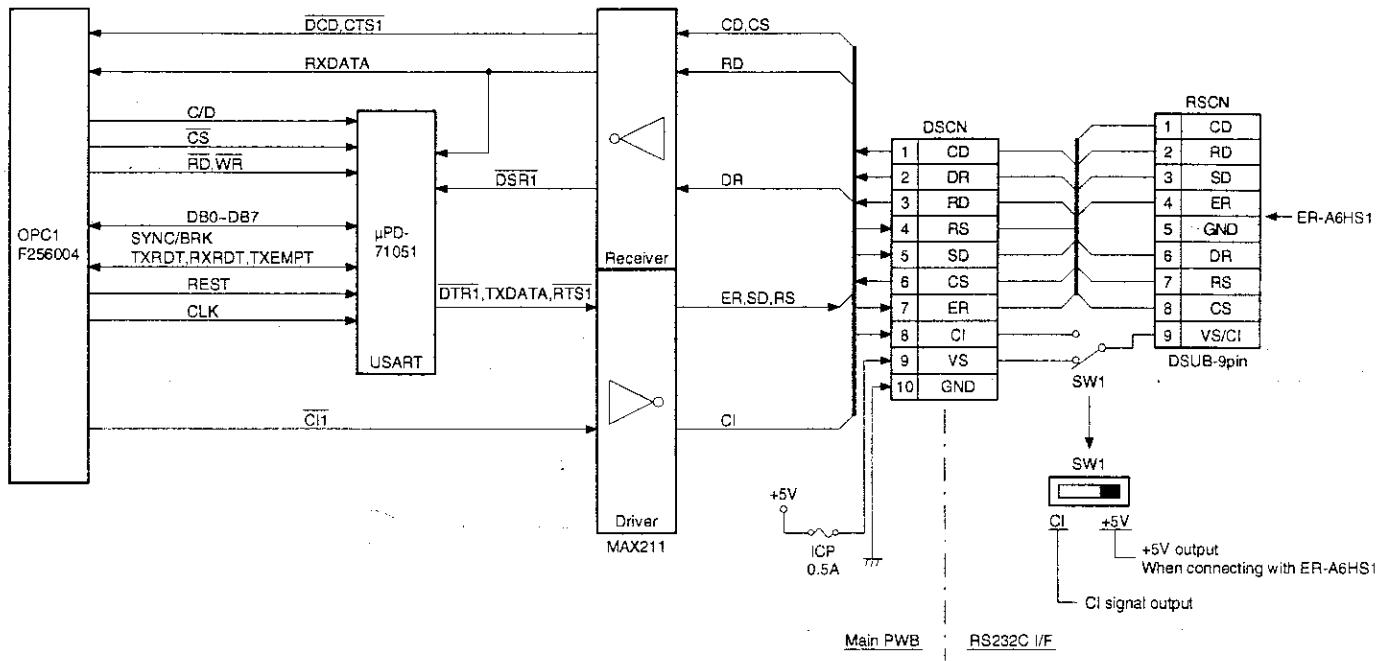

ION: Current when TR1 is on.

IOFF: Current when TR1 is off.

12. Scanner interface

The ER-A610 includes the RS-232 interface which has the power supply function to the hand scanner (ER-A6HS1) as a standard provision.

1) Block diagram

When the ER-A6HS1 is connected, +5V power is supplied to Pin 9 of the RS-232 connector.

SW1 on the RS-232 interface allows switching of the VS signal (+5V) and the CI signal.

CAUTION

A current of 100mA flows through the DSCN connector 8 pin

If a current of 500mA or more flows even in a moment, ICP 0.5A is opened.

2) Description of main LSI

2)-1. OPC1 (F256004PJ)

① General description

The OPC1 is a gate array of integrated peripheral circuits of RS-232/Simple IBC interface.

One chip of the OPC1 is equipped with four communication circuits. (Three of them are for RS-232 only: UNIT 0 ~ 2, one is for selection of simple IBC/RS-232: UNIT 3)

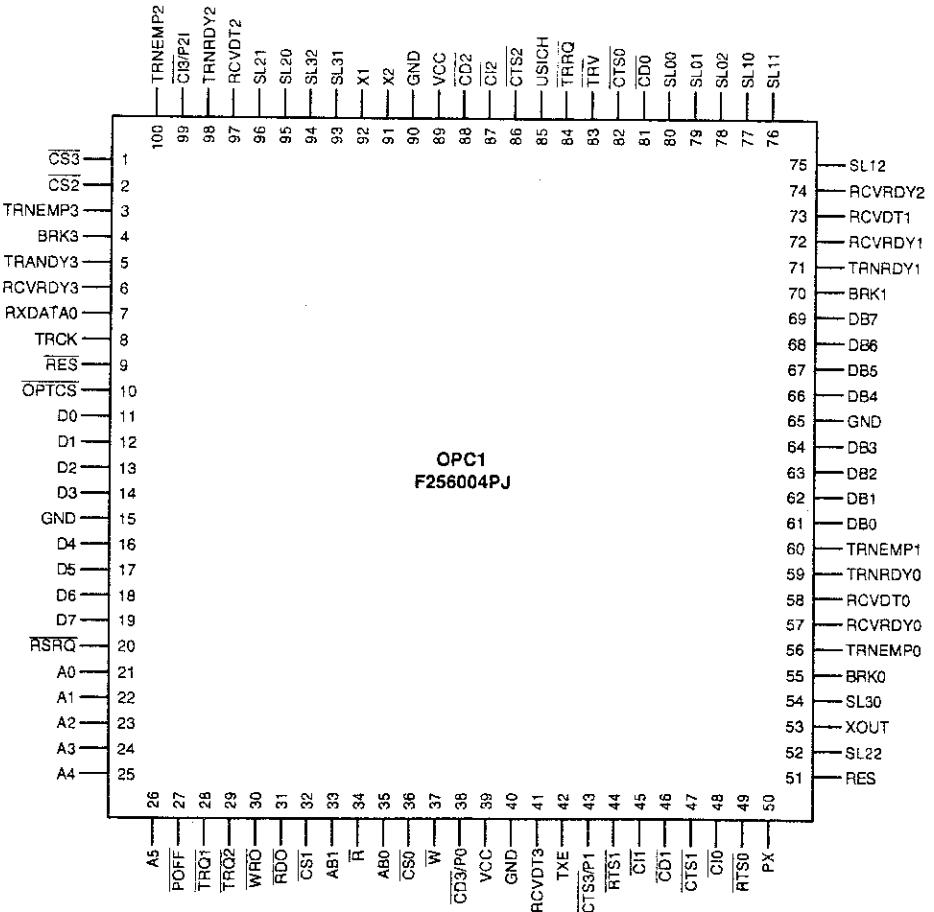

The ER-A610 uses UNIT3 (RS-232 interface)

UNIT NO.	Purpose	ER-A610
UNIT0	RS-232	Not used.
UNIT1	RS-232	Not used.
UNIT2	RS-232	Not used.
UNIT3	RS-232/Simple IRC	Used.

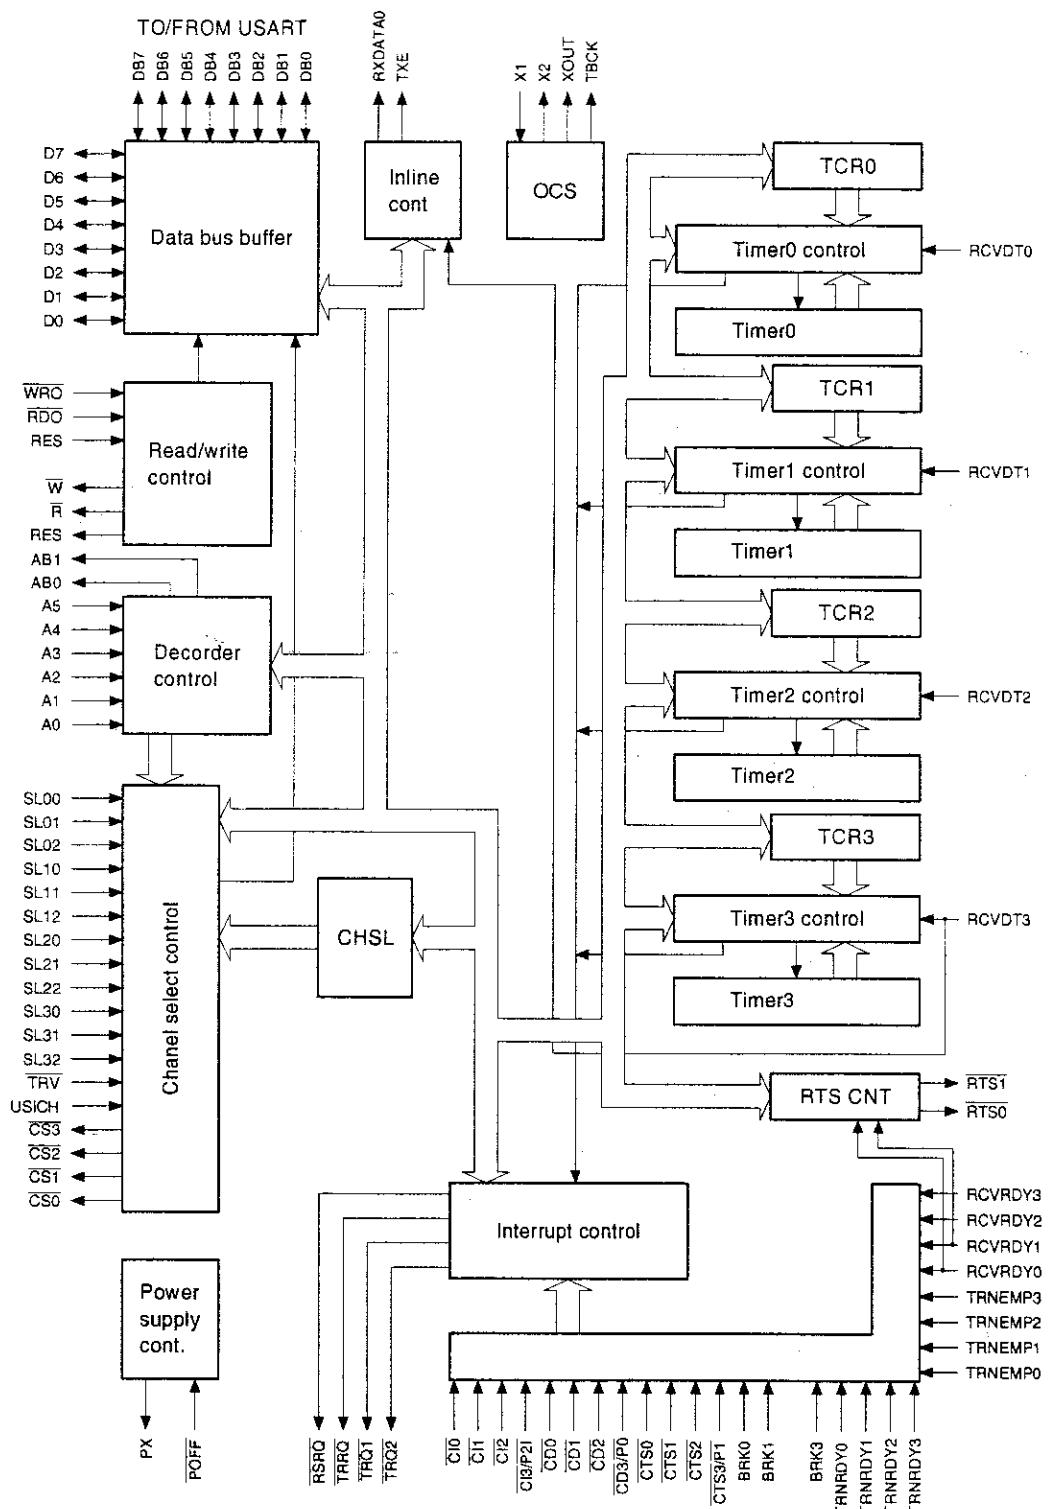

Each UNIT of the OPC1 has the following functions:

- ① Timer function
Used for the timer between characters in data reception.
 - ② Address decode
USART chip select output and own select.
 - ③ Interruption control
 \overline{RSRQ} , \overline{TRRQ} output using outputs from USART (TRNRDY, TRNEMP, RCVRDY, BRK) and RS-232 control signals (\overline{CI} , \overline{CTS} , \overline{CD}) as interruption factors.
(For the simple IRC, TRNEMP is excluded.)
 - * \overline{RSRQ} : For RS-232
 \overline{TRRQ} (Not used): For simple IRC
 - ④ Simple IRC send/receive control (UNIT3 only) : Not used

② Pin configuration

③ Block diagram

④ Pin description

ISC : CMOS level input (internal schmit circuit)

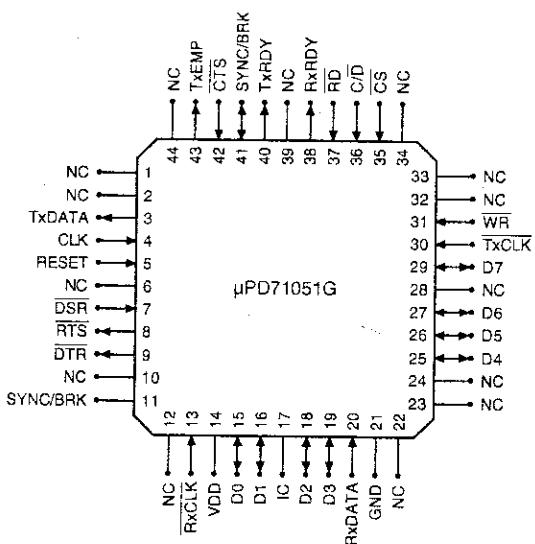

3S : Three state output

IOU : I/O port (internal pullup resistor)

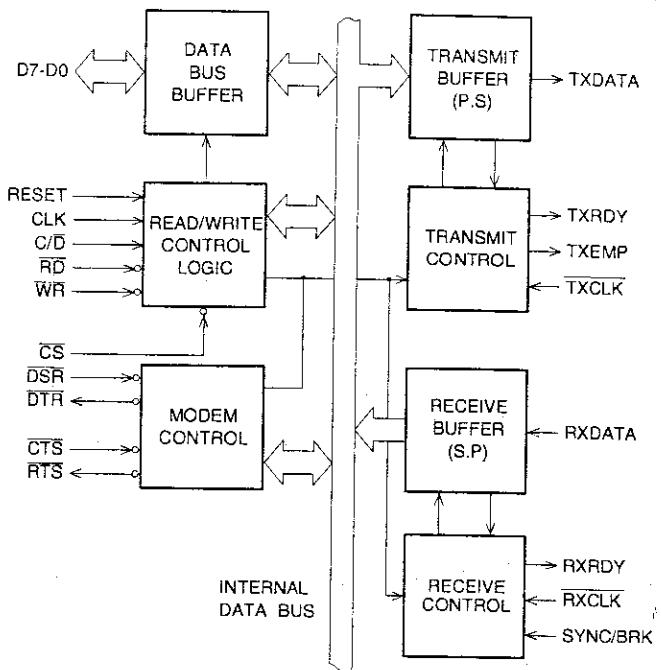

2)-2. Transmission Controller 71051G (USART)

The 7051G is a Universal Synchronous/Asynchronous Receiver/Transmitter (USART) Chip designed for data communications in microcomputer systems. The USART is used as a peripheral device and is programmed by the CPU to operate using virtually any serial data transmission technique presently in use. The USART accepts data characters from the CPU in parallel format and then converts them into a continuous serial data stream for transmission. Simultaneously it can receive a serial data stream and convert them into parallel data characters for the CPU. The USART will signal the CPU whenever it has received a character for the CPU. The CPU can read the complete status of the USART at any time. These include data transmission errors and control signals such as SYNC/BRK, TxEMPT.

① PIN CONFIGURATION

③ BLOCK DIAGRAM

② PIN DESCRIPTION

Pin name	Description
D0-D7	Data bus (8bits)
TXDATA	Transmitter data
TXCLK	Transmitter clock
TXRDY	Transmitter ready
TXEMP	Transmitter empty
RXDATA	Receiver data
RXCLK	Receiver clock
RXRDY	Receiver ready
CLK	Clock pulse
RESET	Reset
DSR	Data set ready
RTS	Request to send data
DTR	Data terminal ready
WR	Write data
CS	Chip enable
C/D	Control or data is to be written or read
RD	Read data
SYNC/BRK	Break
VDD	+5V

CHAPTER 5. TEST FUNCTION

1. General

- 1) This diagnostic program has been developed for diagnosing machine functions in the field. The program is contained with in the ER-A610.

The diagnostic program is stored in the external ROM which will be executed by the CPU (H8/510) which requires the following diagnostic operations:

- a) Proper power supply voltages are mandatory for logic circuits (+5V, VRAM, VCKDC, POFF, 12V, +24V).
 - b) CPU input/output pins, CPU internal logic, CKDC4, MPCA5, TPRC, address decoder, address bus, data bus, and common ROM/RAM must be working properly.

2. Operational procedure

To start the diagnostic program, you must enter the following command:

3-digit test item number → **TL** key in the SRV mode.

The key assignment must be properly set and a part for ROM and IAM must be operating properly to go into this mode because the control jumps to the program area in the SRV mode. A master reset must be performed before operating the ECR for the first time. After any option is installed, a program reset is required. When the master reset or program reset is performed, be sure to check the printout on the journal paper.

Master reset: Turn power on in the SRV' mode and change it to the SRV mode with the **JF** key pressed.

Journal print: **MASTER RESET *****

Program reset: Turn power on in the SRV mode and change it to the SRV mode.

Journal print: PRG. RESET ***

3. Test command list

With the SRV mode and the following command entry, the test starts.

Code	Description
100	Display test-1
101	Key, clerk, and switch position code display
102	R/J printer test
103	Slip printer test
104	Keyboard test
105	Mode switch test
106	Validation sensor and near end sensor test
107	BOF, TOF and IFV test
108	Calendar oscillator test
109	SSP test
110	Drawer-1 open and sensor test
111	Drawer-2 open and sensor test
112	Drawer-3 open and sensor test
113	Drawer-4 open and sensor test
116	Display test-2
117	SIO test-1
120	Standard RAM test
130	Standard ROM test
150	R/J printer dot pulse width adjustment
200	Option RAM chip test
206	
300	Option RAM address test
306	
400	Option ROM test
500	RS-232 Channel check
501	RS-232 Channel 1 check

[1] Display test-1

- ① Key operation
100 → **TL**

② Functional description
The following is displayed

DOT DISPLAY : 0123456789 ;АаВвСс

POP-UP DISPLAY: 4,5,6,7,8,9,-,

- ③ Check the following items:
 - a) Check for proper activation of display elements.
 - b) Check for blur, uneven illumination, and partial omission.
 - ④ Test termination
Press any key. The test terminates with the test and message printed.

100

[2] Key, cashier, and switch position code display

- ① Key operation
101 →

DOT DISPLAY : **C L O O O SW O K O O O**

↑ ↑ ↑

Clerk code Key code

Receipt SW code

- ② Functional description
Key, clerk, and receipt switch codes are displayed.

③ Check the following items:
Change key and switch positions for proper display activation.
Clerk code: Stay down key
000 (off state)
001 (Clerk A)
002 (Clerk B)
004 (Clerk D)
008 (Clerk E)
Receipt switch code: 2 (on state) 3 (off state)
Key code: --- (simultaneous two key depression, invalid entry)
001 ~ 126

NOTE: Refer to JOB#104, key soft code, for the key code. (Fig. 3-2.)

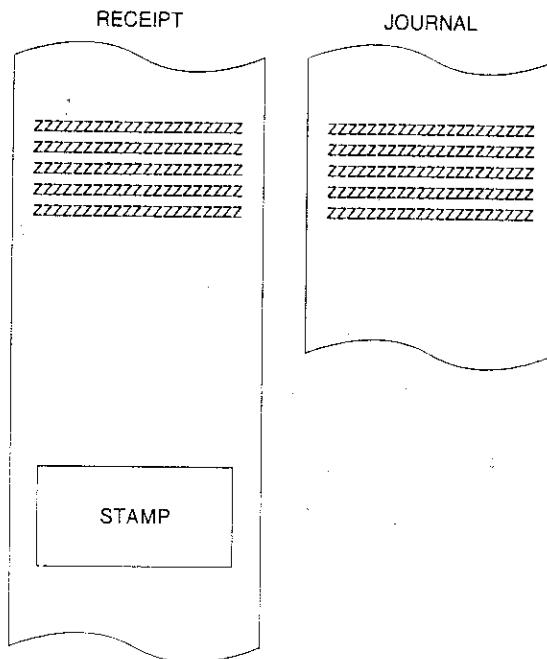

④ Test termination
Change the MODE switch position other than SRV position to terminate the test. The test termination message is printed.

101

[3] R/J printer test

- ① Key operation
102 → **TL**

② Content
Five lines of "Z" characters are printed as follows on the receipt and the journal regardless of receipt (ON/OFF) switch setting.

- ③ Check content
 - 1. Check that the slanted lines of "Z" characters are clearly printed.
 - 2. Check that the characters are printed at a uniform density.
 - 3. Check the paper feed operation and the logo print.
 - 4. Check partial cut and full cut.
 - ④ Termination

This check is terminated automatically.
The termination print is not performed.

[4] Slip printer test

- ① Key operation
As slip must be set on the print table.
103 → **TL**
 - ② Functional description
Regardless of paper setting, 35 digits of "Z" are printed on five lines, then the printer stops after releasing the paper.
 - ③ Check the following items:
 - a) Print starting position must line up in the same column.
 - b) Check the print quality.
 - c) Make sure that the paper is released at the termination.

<Print sample>

A decorative border consisting of five horizontal rows of a repeating zigzag pattern, rendered in a light gray color.

- ④ Test termination
The test terminates automatically. If the paper release lever is not up, perform JOB#107 BTF, IFV test to release the paper.

If the ER-31SP (printer and I/F PWB unit) is not connected when performing this test, the following error display is made.
To cancel the error state, press any key or shift the mode key position, and the R/J printer will print the error print, terminating the operation.

Error display:

DOT DISPLAY: S L I P . I / F E R F

Error print

R/J printer: E----- 103

[5] Keyboard test

- ① Key operation
104 → **TL**
 - ② Functional description
Key actions of the standard version ER-A610 are tested.
Press keys on the keyboard in the order given in the figure 3-1. If the test has been successful, the test terminates with the printout showing correct action of every key. If an error has occurred in the course of a test, an error message will be printed immediately upon occurrence of the error. When the test is interrupted, the normal test termination printout is not produced.
 - ③ Check the termination print
 - ④ Test termination
When the last key (see next page) is depressed, the test terminates with the termination printout.

Test termination point

***: Key cards that avoided the error

(Additional description on the program specifications)

(Additional description on the program specifications)
When an error occurs during check, the operation is not terminated and the key to be checked on the key table is not incremented and is kept at standby state for being checked.

To terminate compulsorily, press the END key (at the right bottom). In this case also, the error print is not made.

The display specification is as follows:

DOT DISPLAY : KEY - BOARD

1

Key cod

[ER-A610]

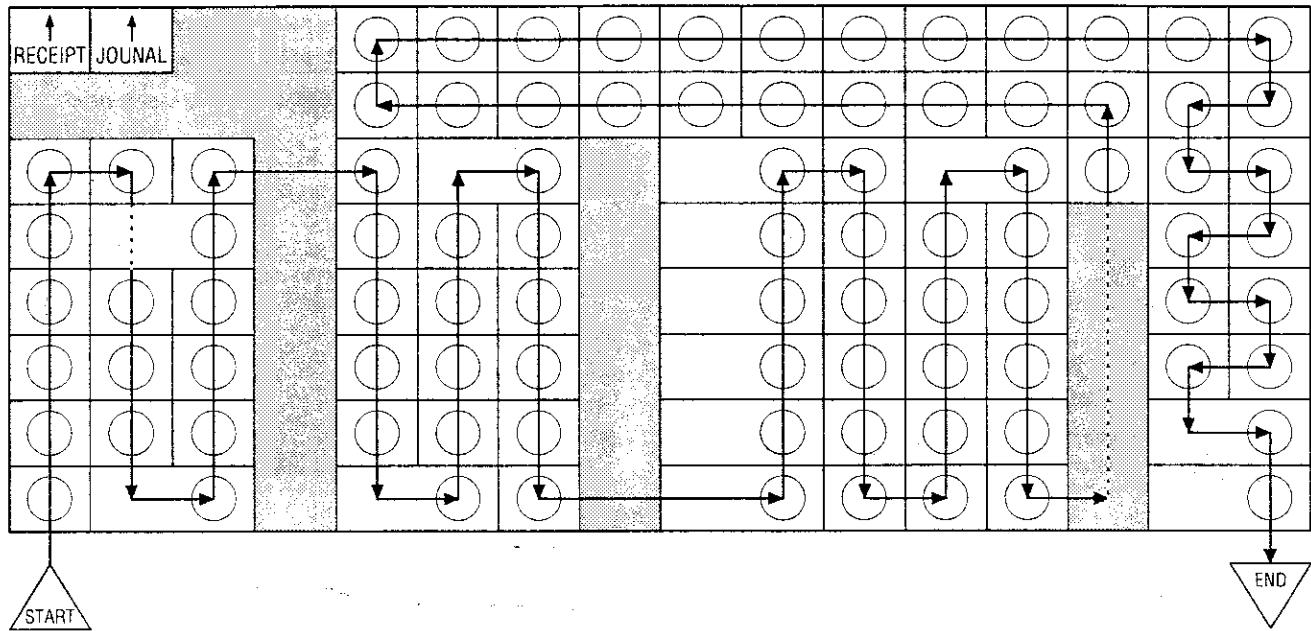

Fig. 3-1: TEST SEQUENSE

RECEIPT	JOURNAL	22	30	38	46	54	62	70	78	86	94	102	110	118	126
7	14	21	29	37	45	53	61	69	77	85	93	101	109	117	125

Fig. 3-2: KEY CODE TABLE

[5] Mode switch test

- ① Key operation
105 → **TL**

② Functional description

This test is applicable for checking of the MODE switch. The MODE switch must be changed as described below to do the test.

Initial state mode: SRV mode

Mode check

Change the MODE switch position in the order given below starting from the SRV position.

DOT DISPLAY : **M O D E S W I T C H X**
X: 0~7,E,F

Mode:	SRV	PGM2	PGM1	⊕ (E)	OP X/Z	REG
X :	0	1	2		3	4
SRV		X2/Z2	X1/Z1		MGR	
0		7	6		5	

(X: E-intermediate position, F-multiple errors)

When the mode key settings in the sequence other than specified is met or when any key pushed, the program execution will terminate immediately upon occurrence, with the error printout produced, except for the mode switch in the middle position. To avoid this, the mode switch must be rotated correctly. Because nothing is interrogated until the mode key returns to the SRV position once after the switch has turned to the "X2/Z2" positions, it needs not to be rotated slowly.

③ Check the following items:

Check to see if the following are displayed and that the termination print is produced

④ Test termination

When the test has been completed according to the given procedure, the test automatically terminates with the termination message printed. To terminate the test in the middle of an operation, merely depress any key, then, the test will terminate with the error message printed. When an error was encountered, the test automatically terminates with the error message printed on the printer.

105 | E----| 105 |

Test termination print Error print (any key depression)

[6] Validation sensor and near end sensor test

The validation sensor and the near end sensor are optional units.

- ① Key operation
106 → **TL**

② Functional description

State of the validation and near end sensor is sensed and displayed.

③ Check the following items:

On and off actions of the validation and near end sensors are tested and their results are displayed.

ON/OFF check is performed for VDS and NES and the display is checked.

DOT DISPLAY : **V D S x y N E S z**

x: State of the VDSR sensor
y: State of the VDSJ sensor
z: State of the NES sensor

Display	X/Y/Z	Description
VDSR	O	Validation sensor (JOURNAL) not detected
	C	Validation sensor (JOURNAL) detected
VDSJ	O	Validation sensor (RECEIPT) not detected
	C	Validation sensor (RECEIPT) detected
NES	O	Journal side paper roll near end detected.
	C	Journal side paper roll near end not detected.

NOTE: "C" is always displayed when no sensor is used.

④ Test termination

Any key depression causes the test to terminate with the termination message on printout.

106

Test termination print

[7] BOF, TOF and IFV test

- ① Key operation
107 → **TL**

② Functional description

After releasing the paper, the state of BOF, TOF, and IFV sensor are sensed and displayed.

③ Check the following items:

BOF, TOF: Check the paper set condition.

IFV: Check the connection of the ER-31SP slip printer and slip printer interface.

Check the on and off actions.

DOT DISPLAY : **I F V z B T F x y**

x: State of IFV

y: State of the BOF sensor

z: State of the TOF sensor

Display	x/y	Description
IFV	O	Slip printer or slip printer interface not in connection
	C	Slip printer or slip printer interface connection
BOF	O	Slip paper not detected
	C	Slip paper detected
TOF	O	Slip paper not detected
	C	Slip paper detected

④ Test termination

Any key depression terminates the test with the termination print.

107

Test termination print

Note 1: Before performing this test, connect the slip printer and the slip printer I/F. If not, "SLIP I/F ERR" occurs.

Note 2: Before turning on/off the connector for IFV checking, be sure to set the mode to other than SRV and turn off the power.

[8] Calendar oscillator test

- ① Key operation
108 → **TL**

Functional description

This program is used to test the calendar oscillator function.

DOT DISPLAY : **T I M E R C H E C K**

POP UP DISPLAY : *** * - * ***
***: Present time

- ② Check the following items:
 - i) Testing blinking "-". (500ms ON and OFF)
- ③ Test termination
Any key depression terminates the test with the termination print.

108
Test termination print

[9] SSP test

- ① Key operation
109 → **TL**
- ② Functional description
If an SSP is programmed, its contents are automatically checked and the result is printed.
- ③ Check the following items:
Check printing of the termination message.
- ④ Test termination
The test terminates automatically after printing the termination print.

109 | E ----- 109 | F ----- 109

Normal end print Error print SSP table full print (NOTE)

Note: In this SSP check, set the data for check in the empty area of SSP entry REG and erase the data for check after completion of check. Therefore, SSP setting before check is not cleared. If, therefore, there is no SSP entry REG remained for SSP check, F-print (SSP entry register full print) is performed to terminate the program without check.

[10] Drawer open sensor test

- ① Key operation
110~113 → **TL**
- ② Functional description
The drawer indicated by the job number is opened to check the proper action.

Drawer opened:	O indicated
Drawer closed:	C indicated
110: Drawer-1:	Option drawer
111: Drawer-2:	Remote drawer
112: Drawer-3:	Remote drawer
113: Drawer-4:	Remote drawer

DOT DISPLAY : **D R A W E R x y**

x: 1~4
y: O= Drawer opened
C= Drawer closed

- ③ Check the following items:
 - a) Check opening of the specified drawer.
 - b) Check the display indication when the drawer is open and close.
- ④ Any key depression terminates the test with the termination print.

11X
Test termination print X: 0~3

[11] Display test-2

- ① Key operation
116 → **TL**
- ② Functional description
The display CGs in CKDC4 are checked. The 256 CGs are grouped into 32 blocks and each 8 characters is displayed on the dot display.
The check start with CG code 00H - 07H, and the following blocks are sequentially displayed when any key is pressed.

DOT DISPLAY : **x, y : ○ ○ ○ ○ ○ ○ ○ ○**

○: CG display position
xy: The initial code of each block is displayed in hexadecimal (For example, A0, B8)

- ③ Check the following items:
 1. Check that the display is normal.
 2. Check that there is no blur, defects, and unevenness.
- ④ Test termination
To terminate the test, set the mode key to any mode other than SRV mode.

116

Test termination print

[12] SIO test-1

- ① Key operation
117 → **TL**
- ② Functional description
The following two kinds of loopback tests are carried out using the special service tool (UKOG-6704RCZZ) to check the trans and receive data, ready, and not ready signals.
Test-1: Checks ER - DR, RS-CD and RR-CS
Test-2: Checks TXD - RXD
- ③ Check the following items:
Successful test results must be checked on the display and the termination message print.
- ④ Test termination

117 | EX ----- 117

Termination print

X = 1: Non connect error
2: Verify error
3: Hardware error
4: P-OFF
5: Timer overflow error

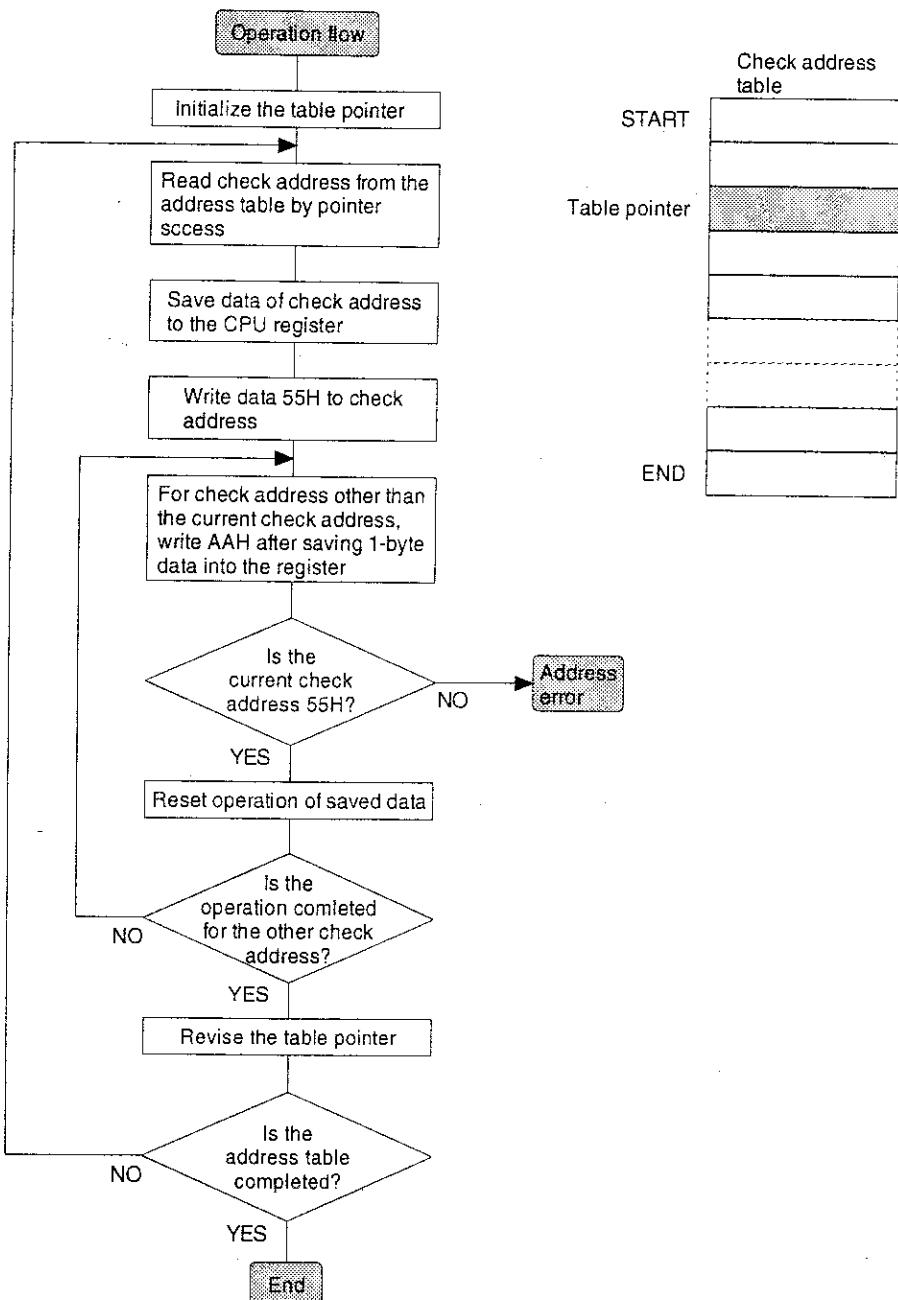

[13] Standard RAM test

- ① Key operation
120 → **TL**
- ② Functional description
Perform the following check for the standard RAM 128 KByte SRAM. The memory contents should not be changed before and after the check.
Perform the following processes for memory address to be checked (1C000H~1DFFFFH).
PASS1: Save memory data.
PASS2: Write data "0000H."
PASS3: Read and compare data "00H," write data "55H."
PASS4: Read and compare data "55H," write data "AAH."
PASS5: Read and compare data "AAH."
PASS6: Restore the memory data.

If a comtare error occurs in the check sequence PASS1-PASS6, an error print is made. If no error occurs through all address, the check ends normally.

The following address check is performed further.

Check point address = 1C0000H, 1C0001H
1C0002H, 1C0004H
1C0008H, 1C0010H
1C0020H, 1C0040H
1C0080H, 1C0100H
1C0200H, 1C0400H
1C0800H, 1C1000H
1C2000H, 1C4000H
1C8000H, 1D0000H

- ③ Check the following items:
Check the termination printout.

- ④ Test termination
The test terminates after printing the termination printout.
Termination printout:

Normal termination	120
Abnormal termination	Ex - - - - 120

X = 1: Data check error
2: Address check error

Note: When an error occurs, the error print is performed and the check is terminated. The error occurrence address is shown in hexadecimal at positions shown with *****.

[14] Standard ROM test

- ① Key operation
130 → **TL**

- ② Functional description
Sum check of the standard ROM (C00000H - C7FFFFH) is performed. If the lower two digits of SUM is 10H, it is normal.

DOT DISPLAY: **S T D R O M**

- ③ Check the following items:
Check the printout after the test.

- ④ Test termination
The test automatically terminates with termination message.

Normal termination print	130
S-ROM	27040*****
Error termination print	130
S-ROM	27040*****

Note: "*****" means the ROM version number.

The underlined section (10 bytes) of code table is provided in the ROM as a standard and the table content is always printed.

The table position is the upper 10 digits of the ROM address.
The check sum correction address is the last address -0FH.

Note: In the case of the ER-ROM, the ROM version number is displayed in the upper and the lower stages.
In the case of the MASK-ROM (future specification), the MASK ROM code is displayed in the upper stage, and the ROM version number is displayed in the lower stage.

S-ROM	27040RAJ1A	130
	RAJ1A	
O-ROM	27020RAP1A	400
	RAP1A	

[15] R/J printer dot pulse width adjustment

The dot pulse width adjust circuit is provided to control the width of the current applied to the dot head of the printer KI-OB6754RC01, according to a supply voltage fluctuation.

When the circuit is changed with a new one for such as a repair work, the dot pulse width needs to be adjusted using the 200K pot VR1.

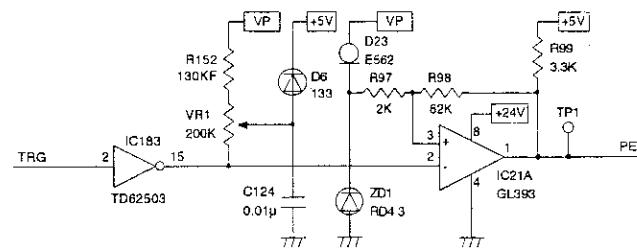

Fig. 3-3

Dot pulse adjusting method

1. Turn power on.
2. Measure the voltage of the VP line between the fuse F1 and GND. Use a digital voltmeter capable of measuring 100mV steps.
3. Set the MODE switch to the SRV position and start the diagnostic program Job #150 with the next command procedure.
150 → **TL**
4. Adjust pulse width of TPW at the test point TP1 as shown in the graph in Fig.3. The pulse width of TPW can be adjusted using the 200K pot VR1.
5. To terminate the diagnostic program, just press any key.

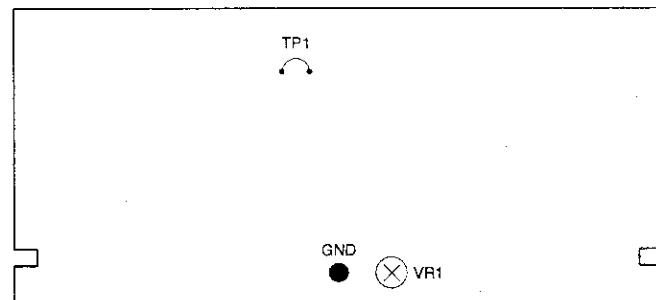

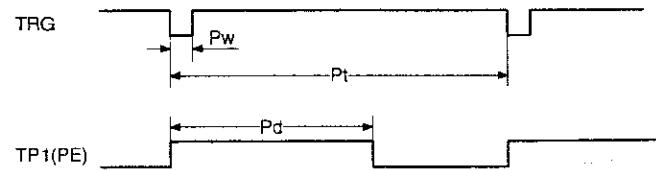

Fig. 3-4

$P_w \approx 4\mu s$
 $P_t \geq 1000\mu s$
Pd is adjusted to 518 usec when V_p is +24.0V.

Fig. 3-5

* For the adjustment of VP, refer to CHAPTER 7. SERVICE PRECAUTION. (Printer printing speed adjustment)

[16] Option RAM test

- ① Key operation
20X → **TL**

JOB #NO.	RAM NO.	Memory to be checked	Address area to be checked
200	Option RAM (main)	ER-01RA	1E0000H ↓ 1E7FFFH
201	Option RAM (main)	ER-02RA	1E0000H ↓ 1FFFFFFH
202	ER-01MB RAM1	ER-02RA+ER-01MB	1E0000H ↓ 21FFFFFFH
203	ER-01MB RAM2	ER-02RA+(ER-01MB+ER-02RA)	1E0000H ↓ 23FFFFFFH
204	ER-01MB RAM3	ER-02RA+(ER-01MB+ER-02RA×2)	1E0000H ↓ 25FFFFFFH
205	ER-01MB RAM4	ER-02RA+(ER-01MB+ER-02RA×3)	1E0000H ↓ 27FFFFFFH
206	ER-02MB	ER-02RA+ER-02MB	1E0000H ↓ 2FFFFFFH

② Content

The following check are performed for the optional RAM.
The following process is performed for memory address to be checked.

PASS1: memory data save

PASS2: Data "00H" write

PASS3: Data "00H" read and comparison, data "55H" write

PASS4: Data "55H" read and comparison, data "AAH" write

PASS5: Data "AAH" read and comparison

PASS6: Memory data restore

If a compare error is found in the check sequence from PASS1 to PASS6, error print (error code E1) is performed. If there is no error found to the end of the last address, the operation is completed normally.

Then the following address check is performed by judging the option chip to be integrated. The check point addresses are as follows:

Check Address	JOB200	JOB201	JOB202	JOB203	JOB204	JOB205	JOB206
1E0000H	○	○	○	○	○	○	○
1E0001H	○	○	○	○	○	○	○
1E0002H	○	○	○	○	○	○	○
1E0004H	○	○	○	○	○	○	○
1E0008H	○	○	○	○	○	○	○
1E0010H	○	○	○	○	○	○	○
1E0020H	○	○	○	○	○	○	○
1E0040H	○	○	○	○	○	○	○
1E0080H	○	○	○	○	○	○	○
1E0100H	○	○	○	○	○	○	○
1E0200H	○	○	○	○	○	○	○
1E0400H	○	○	○	○	○	○	○
1E0800H	○	○	○	○	○	○	○
1E1000H	○	○	○	○	○	○	○
1E2000H	○	○	○	○	○	○	○
1E4000H	○	○	○	○	○	○	○
1E8000H	—	○	○	○	○	○	○
1F0000H	—	○	○	○	○	○	○
200000H	—	—	○	○	○	○	○
210000H	—	—	○	○	○	○	○
220000H	—	—	—	○	○	○	○
240000H	—	—	—	—	○	○	○
260000H	—	—	—	—	—	○	○
280000H	—	—	—	—	—	—	○

"○" in the table shows that the check point address in the horizontal column is valid, and "—" shows it is invalid.

When any error occurs in this address check, error code E2 is printed.

③ Check the following items.

Check the termination print.

④ Test termination

The test terminates after printing the termination printout.

Termination print

Normal termination	20X
Abnormal termination	EY---- 20X *****

20X: JOB # (200~206)

Y: Error code

Note: When an error occurs error print is performed and the error address is displayed in position ***** in hexadecimal.

[17] Option RAM address test

① Key operation

30X → **TL** (X: 0~6)

JOB #NO.	RAM NO.	Memory to be checked	Address area to be checked
300	Option RAM (main)	ER-01RA	1E0000H ↓ 1E7FFFH
301	Option RAM (main)	ER-02RA	1E0000H ↓ 1FFFFFFH
302	ER-01MB RAM1	ER-02RA+ER-01MB	1E0000H ↓ 21FFFFFFH
303	ER-01MB RAM2	ER-02RA+ (ER-01MB+ER-02RA)	1E0000H ↓ 23FFFFFFH
304	ER-01MB RAM3	ER-02RA+ (ER-01MB+ER-02RA×2)	1E0000H ↓ 25FFFFFFH
305	ER-01MB RAM4	ER-02RA+ (ER-01MB+ER-02RA×3)	1E0000H ↓ 27FFFFFFH
306	ER-02MB	ER-02RA+ER-02MB	1E0000H ↓ 2FFFFFFH

② Functional description

The following check are performed for the optional RAM. Do not change.

Check Address	JOB300	JOB301	JOB302	JOB303	JOB304	JOB305	JOB306
1E0000H	○	○	○	○	○	○	○
1E0001H	○	○	○	○	○	○	○
1E0002H	○	○	○	○	○	○	○
1E0004H	○	○	○	○	○	○	○

1E0040H	○	○	○	○	○	○	○
1E0080H	○	○	○	○	○	○	○
1E0100H	○	○	○	○	○	○	○
1E0200H	○	○	○	○	○	○	○
1E0400H	○	○	○	○	○	○	○
1E0800H	○	○	○	○	○	○	○
1E1000H	○	○	○	○	○	○	○
1E2000H	○	○	○	○	○	○	○
1E4000H	○	○	○	○	○	○	○
1E8000H	—	○	○	○	○	○	○
1F0000H	—	○	○	○	○	○	○
200000H	—	—	○	○	○	○	○
210000H	—	—	○	○	○	○	○
220000H	—	—	—	○	○	○	○
240000H	—	—	—	—	○	○	○
260000H	—	—	—	—	—	○	○
280000H	—	—	—	—	—	—	○

"○" in the table shows that the check point address is valid, and "—" shows that it is invalid.

- ③ Check the following items.
Check the termination printout.

- ④ Test termination

The test terminates after printing the termination printout.

Termination printout

Normal termination	30X
Abnormal termination	EY--- 30X *****

30X: JOB# (300~306)

Y: Error code

Note: When an error occurs error print is performed and the error address is displayed in position ***** in hexadecimal.

[18] Option ROM test

- ① Key operation:

400 → **TL**

- ② Functional description:

A sum check is done for the option ROM (Address hex C8000H thru CBFFFFH.)

DOT DISPLAY : **O P T R O M**

- ③ Check the following items:
Check the termination printout.

- ④ Test termination:

The test terminates after printing the termination printout.
Termination printout

Normal termination	400
O-ROM	27020*****
E-----	400 *****
O-ROM	27020*****

The underlined section must be the same as the standard ROM test specification. (Refer to JOB #130.)

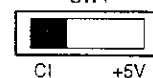

[19] RS-232 test

The channel check of the scanner I/F RS-232 connector (D-sub, 9 pin) is performed.

Execute the following procedures with the power switch OFF.

- Set the I/F SW1 to the CI signal side.

SW1

- Connect the RS-232 loop back connector (UKOG-6705RCZZ).

1) Channel check**① Activation**

The program is activated by JOB#500

SRV mode: 500 → **TL**

② Contents to be tested

Information about connected RS-232 channel is printed.

* For RS-232 for the ER-A610 scanner, CH1 is used.

Printing

digit	21	20	19	18	17	16	15	3	2	1
	1	1	1	1	1	1	0	5	0	0
	CH7	CH6	CH5	CH4	CH3	CH2	CH1			

CHn = 0 : Presence of channel
1 : Absence of channel

③ Confirmed content

Printed contents and the setting of channel changeover switch on PWB are compared and confirmed.

④ Release

The program is terminated after the above contents are printed.

2) RS-232 Channel 1 check**① Activation**

The program is activated by JOB#501.

SRV mode: 501 → **TL** : Channel 1

② Contents to be tested

If the channel specified by JOB#CODE is not set, the machine performs the mis-operation processing. When the channel is set, the machine conducts the loop check concerning the channel specified by JOB#CODE by using the loopback connector.

The following three items are checked:

① Control signal check

② Data transfer check

③ Timer check (RS-232 onboard timer)

Check ① Control signal check (**ERn-DRn-CIn**, **RSn-CDn-CSn** loop check)

OUTPUT		INPUT			
ERn	RSn	DRn	CIn	CDn	CSn
OFF	OFF	OFF	OFF	OFF	OFF
OFF	ON	OFF	OFF	ON	ON
ON	OFF	ON	ON	OFF	OFF
ON	ON	ON	ON	ON	ON

The read check about the above INPUT items and interrupt check of CS, CI and CD are performed.

Read check: **ER** and **RS** are switched over in the order as shown in the above table to confirm the logic of DR, CI, CD and CS. If the read logic is different from the one in the table, error print-outs occur.

Interrupt check: Allows the interruption of either of CS, CI and CD one by one. (The mask is released.)
The interruption does not take place when each signal is turned on. Or if the interruption occurs when a signal is turned off, error print-outs occur.

Each of the above checks should be made in four cycles.

Note) **ERn** control selector jumper switch on the I/F board must be switched to the software control side.

Check ② Data transfer check (SDn-RDn loop check)

In this check, transfer 256-byte loopback data of \$00 ~ \$FF.

Note) The above check should be made with the baud rate set at 9600BPS.

Check ③ Timer check

Before making check ②, set the corresponding timer a 10ms for RCVDT activation, and check to see that:

- 1) **TRQ1** is not generated during the execution of check ②.
- 2) **TRQ1** is generated in 10msec. after check ② is finished.

③ Contents to be checked

If an error occurs during the above checks, following error print-outs occur. Even if an error occurs during check ①, the test is continued after the corresponding error print-out has occurred, but if an error occurs during the execution of check ② or ③, the test is terminated after the corresponding error print-out has occurred.

Note that when check ①, ② or ③ terminates, the termination print-out occurs irrespective of any errors that have occurred during the check. (The program terminates normally only when no error print-out has occurred.)

ERROR	ERROR PRINT	Contents
1	E1-ER DR	ERn-DRn ERR
2	E2-ER CI	ERn-CIn ERR
3	E3-RS CD	RSn-CDn ERR
4	E4-RS CS	RSn-CSn ERR
5	E5-CI INT	Interruption error of CIn
6	E6-CD INT	Interruption error of CDn
7	E7-CS INT	Interruption error of CSn
8	E8-TXEMP	TXEMPN error
9	E9-TXEMP I	Interruption error of TXEMPN
10	E10-TXRDY	TXRDYn error
11	E11-TXRDY I	Interruption error of TXRDYn
12	E12-RCVRDY	RCVRDYn error (Reception is impossible. TRQ1 has occurred during execution of check ②.)
13	E13-RCVRDY I	Interruption error of RCVRDY
14	E14-SD RD	SDn-RDn ERR (Data error)
15	E15-SD RD	SDn-RDn ERR (Data error, Flaming error)
16	E16-TIMER	TIMERn error (TMRQn cannot be set after termination of check ②.)
17	E17-TIMER I	Interruption error of TRQ1

Errors that may occur during check ① (control signal check): E1 ~ E7

Errors that may occur during check ② (data transfer check): E8 ~ E15

Errors that may occur during check ③ (timer check): E12, E16 and E17

④ Cancellation

The program automatically terminates when a check is finished.

Termination print-out:

CHAPTER 6. DOWN LOAD FUNCTION

1. General

RAM data can be transmitted in the following two methods.
Save the data before servicing as follows:

- ① ECR → ECR

- Cable: ER-A5CB

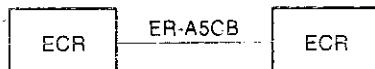

Fig. 1-1

- ② ECR → ER-02FD

- Cable: Cable (QCNW-7578RCZZ) packed with the ER-02FD

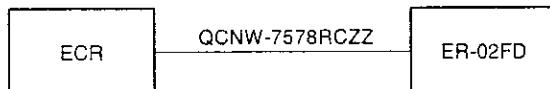

Fig. 1-2

2. SIO interface specification

- Operation: Simplex
- Line configuration: Direct connect
- Data rate: 19200, 9600, 4800, 2400, 1200, 600, 300BPS (Selected by SRV JOB#903-A)
- Sync mode: Asynchronous
- Checking: Vertical parity (odd)
- Code: 7 bits (ASCII)
- Bit sequence: LSB first
- Line level: TTL level
- Data format:

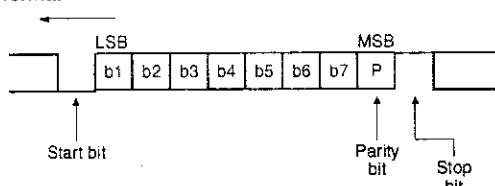

Fig. 2-1

3. Location of connector pins

- ① ER-A5CB

TCP8913

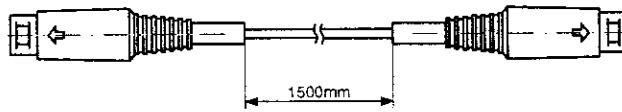

Fig. 3-1

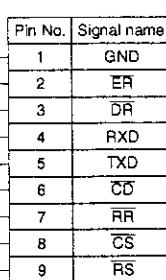

Fig. 3-2

- ② QCNW-7578RCZZ

TCP8913

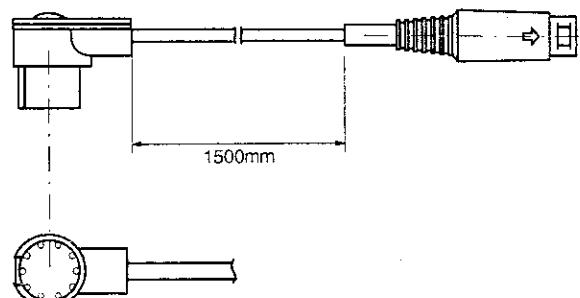

Fig. 3-3

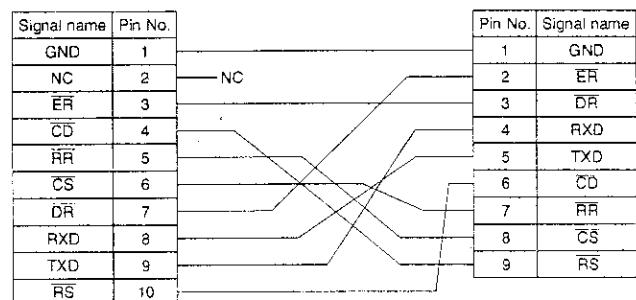

Fig. 3-4

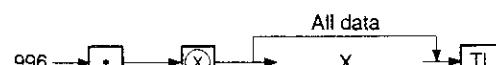

Interfacing signals

Pin No.	Signal name	In/Out	On level	Description
1	GND	—	—	Signal ground
2	ER	Out	Low	Equipment ready
3	DR	In	Low	Data set ready
4	RXD	In	High: MARK Low: SPACE	Receive data
5	TXD	Out	High: MARK Low: SPACE	Transmit data
6	CD	In	Low	Carrier detect
7	RR	Out	Low	Ready to receive
8	CS	In	Low	Clear to send
9	RS	Out	Low	Request to send

4. Application specification

The following service (SRV) modes are available for the serial data transfer of the ER-A610.

- 1) Data transmit (Source side)

X: 0=SSP DATA

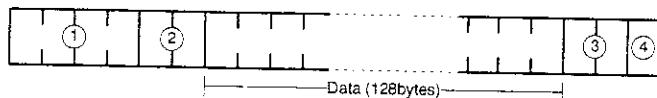

- 1 = Standard RAM+01RA/02RA
- 2 = 01MB (0.5MB)/02MB (0.5MB:1st half)
- 3 = 02MB (0.5MB: 2nd half)

- 2) Data receive (Target)

5. Data format

A single byte image of the RAM data to be transmitted is divided into a high order 4 bits and low order 4 bits and converted into ASCII code. Then, the image of the memory is sent in the following format:

① Memory top address: 0000H ~ FFFFH
Top address of the memory to be transmitted in ASCII number.

② Page: 1D ~ 1F
Page of the memory to be transmitted in ASCII number.

③ Sum check

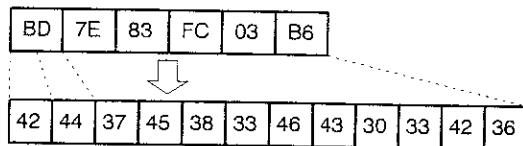

④ End code:
Hex 0D

NOTE:

- In order that contents of RAM memory may not over-ride pages for this job, RAM image is sent in unit of 64 bytes from the address 0000. In other words, 128 bytes are sent at one time on the transmit data format.

RAM DATA FORMAT

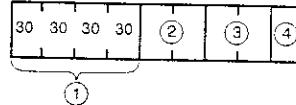

Exhibit:

Code table

HEX	ASCII	Character
0	30	0
1	31	1
2	32	2
3	33	3
4	34	4
5	35	5
6	36	6
7	37	7
8	38	8
9	39	9
A	41	A
B	42	B
C	43	C
D	44	D
E	45	E
F	46	F

6. END record

① End message:
Fixed to 30303030.

② End message:
Fixed to 4646.

③ Sum check

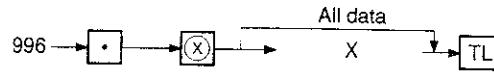

④ End code:
CR (0D)

7. Operational method

- To prepare an ER-A610 to receive data from another ER-A610 or the ER-02FD, the memory size of the receiving unit must be the same as or greater than the sending unit.
- Master reset the receiving ER-A610.
- Match the baud rate of the transmitter with the receiver using JOB#995 in the SRV mode.
- Connect loader cable (QCNW-7578RCZZ or ER-A5CB) between ER-A610s.
- Set the receiving ER-A610 ready to receive.

- Start the sending ER-A650.

X: 0 = SSP

1 = Standard RAM+01RA/02RA
2 = 01MB (0.5MB)/02MB (0.5MB:1st half)
3 = 02MB (0.5MB: 2nd half)

- Transmission status.

Description of error status

- Application error (Command error)
- Line error (DTR OFF)
- Application error (Parity error)
- Application error (Check sum error)
- Application error (Data size error)
- Hard ware error
- Power off error
- Time out error
- Application error (Transmit data size error)
- Application error (Block sequence error)
- Memory full error

- Service reset the receiving ER-A610.

8. Saving/Loading of data to/From the FD unit Configuration

- 1) Turn off the power switch of the ER-02FD, and set the DIP switches of the FD unit as follows:

ER-02FD (The ER-01FD functions of the ER-02FD are used.)

DS-1								DS-2			
1	2	3	4	5	6	7	8	1	2	3	4
OFF	ON	OFF	ON	ON	OFF	OFF	OFF	X	OFF	OFF	OFF

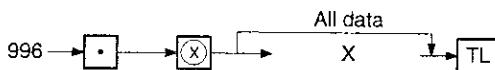

4	6	Rate [bps]
OFF	OFF	19200
ON	OFF	9600
OFF	ON	4800
ON	ON	2400

Disk format	
CCP/M: OFF	
PC-DOS: ON	

- 2) Connect the QCNW-7578RCZZ cable.

Saving data

- 1) Turn on the power switch and insert a floppy disk which has been formatted.
2) Start the SEND JOB on the ECR side as follows:

X: 0 = SSP
1 = Standard RAM+01RA/02RA
2 = 01MB (0.5MB)/02MB (0.5MB:1st half)
3 = 02MB (0.5MB: 2nd half)

- 3) Data transmission is started and the green lamp on the ER-02FD blinks.

Loading data

- 1) Turn on the power switch and insert the floppy disk which stores the data.
2) Start the RECEIVE JOB on the ECR side as follows:

- 3) Press the **SEND** key on the FD unit.
4) Data transmission is started and the Green lamp on the ER-02FD blinks.
5) Service reset the ECR.

CHAPTER 7. SERVICE PRECAUTION

1. Hints and tips when installing the RAM chip option (ER-02RA)

- 1) When the RAM option (ER-02RA) is to be installed to the main PWB, be sure that the ER-02RA is facing in the right direction.

2. Printer motor lock

In the ER-A610, the motor will automatically turn off when a premature halting of the timing signals occurs due to a paper misfeed, ribbon jam, intrusion of alien object, etc. When the motor stops, an intermittent beeping will occur, with no indication in the display.

<How to reset the motor lock>: R/J printer

- 1) Disconnect the AC cord from the wall outlet. And remove the cause.
2) When power is restored, the following is displayed.

PRINTER ERROR

Fig. 2-1

- 3) Depress the [CL] key to return the ER-A650 to the point where the cause happened. The power failure symbols will be printed after a line feed.
4) Print sample

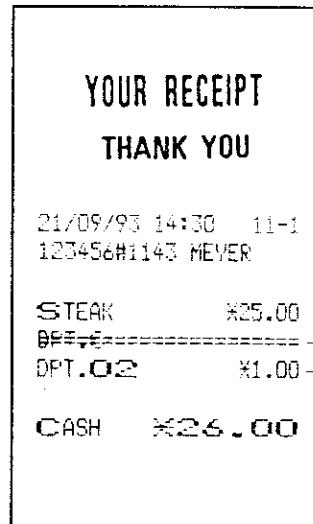

Fig. 2-2

3. Note for upper cabinet installation

When installing the upper cabinet again, be sure to connect the GND wire (QCNW-7120RCZZ) to the proper connector in front of the printer.

4. Others

- 1) If D1 shorts, the VRAM is shorted with the 5V supply. In this event, normal operation is usually possible, except that it may not recharge the battery, failing to back it up, resulting in memory frustration.

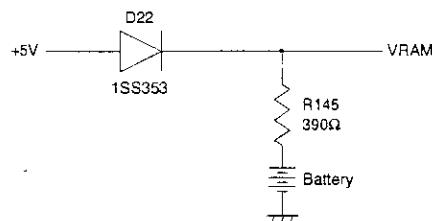

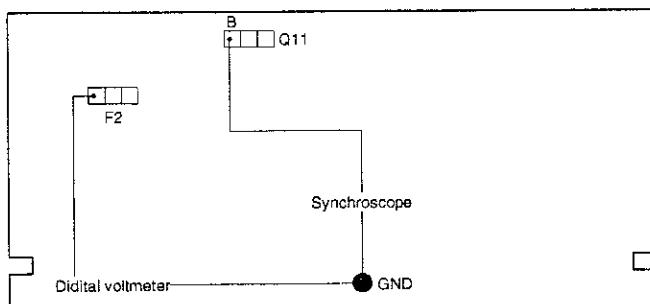

Fig. 4-1

- 2) When installing the option I/F PWB, be sure to connect it to the left side (under the power PWB) when viewed from the rear of the body. Do not use the right side (under the printer).
- 3) When fuse F1 above the main PWB is blown off, be sure to check the zener diode ZD2 (VHERD5.6FP3-1) and the thyristor Q2 (VHSDRA2TE//1) for any damage as well as replace F1. If the diode is damaged, replace it with new one.
- 4) When removing or installing the option slot rear cover, be sure to lift up the pop-up display. Especially when installing the cover, be sure not to pinch the pop-up display cable between the upper cabinet and the cover.

5. Printer printing speed adjustment

When the printer unit or the power PWB is replaced, the following adjustments should be performed.

- 1) Tools required for adjustment
 - ① A synchroscope or a universal counter
 - ② A digital voltmeter
- 2) Adjustment procedure
 - ① Remove fuse F2 from the main PWB.
 - ② Connect the probe of the synchroscope or the digital voltmeter with 1 pin and GND of Q11 (KTD1414) on the main PWB.
 - ③ Connect the digital voltmeter pin with fuse F2 and GND of the main PWB.

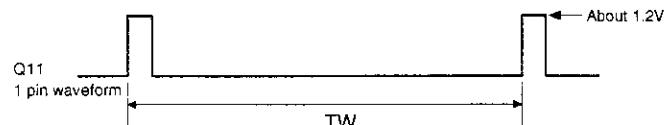

- ④ Perform the master reset.
- ⑤ Turn VR1 on the PS PWB to adjust the voltage to 26.4V (Approx. 2.7 lines/sec).

* Adjust VP so that it is in the range of 24V to 26.4V.

- ⑥ Perform the printing procedure. (Printing is not performed because the fuse is removed.)

- ⑦ Measure the time of TW with the waveform of Q11 1 pin as shown in the figure below.

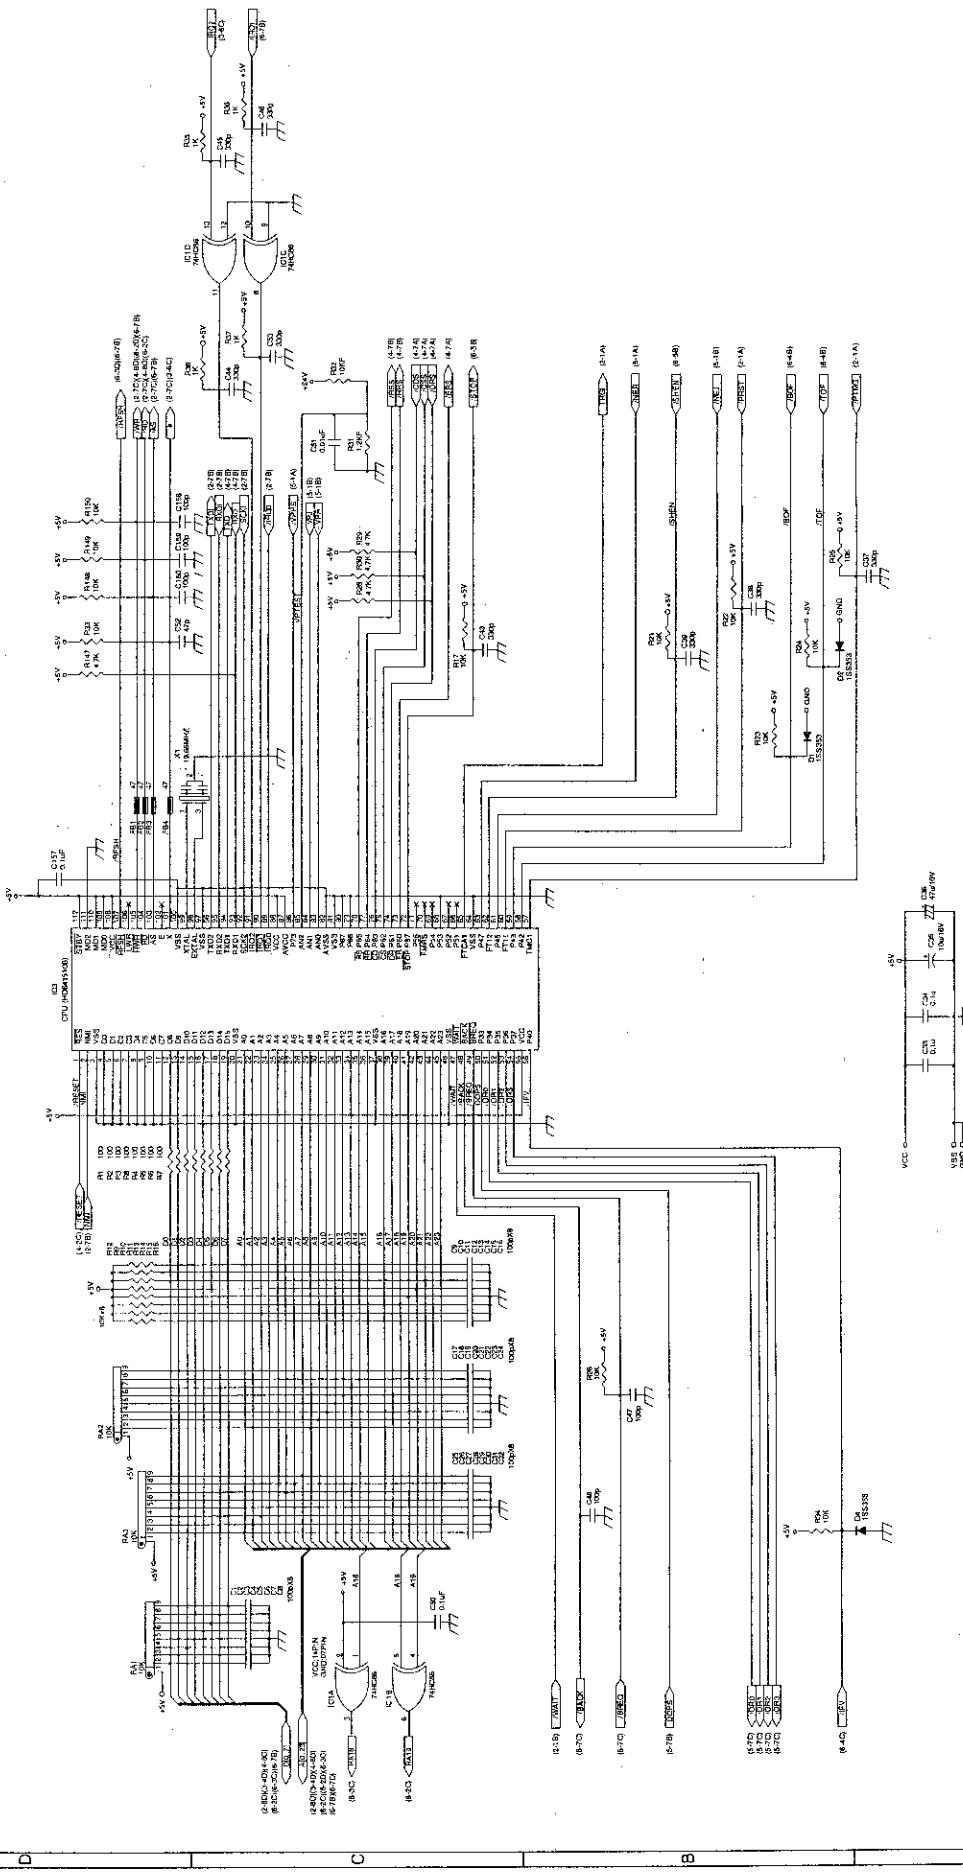

- ⑧ TW ≥ 357 ms: The adjustment is completed.
- ⑨ Turn off the power and disconnect the probe.
- ⑩ Attach the fuse to the original position.

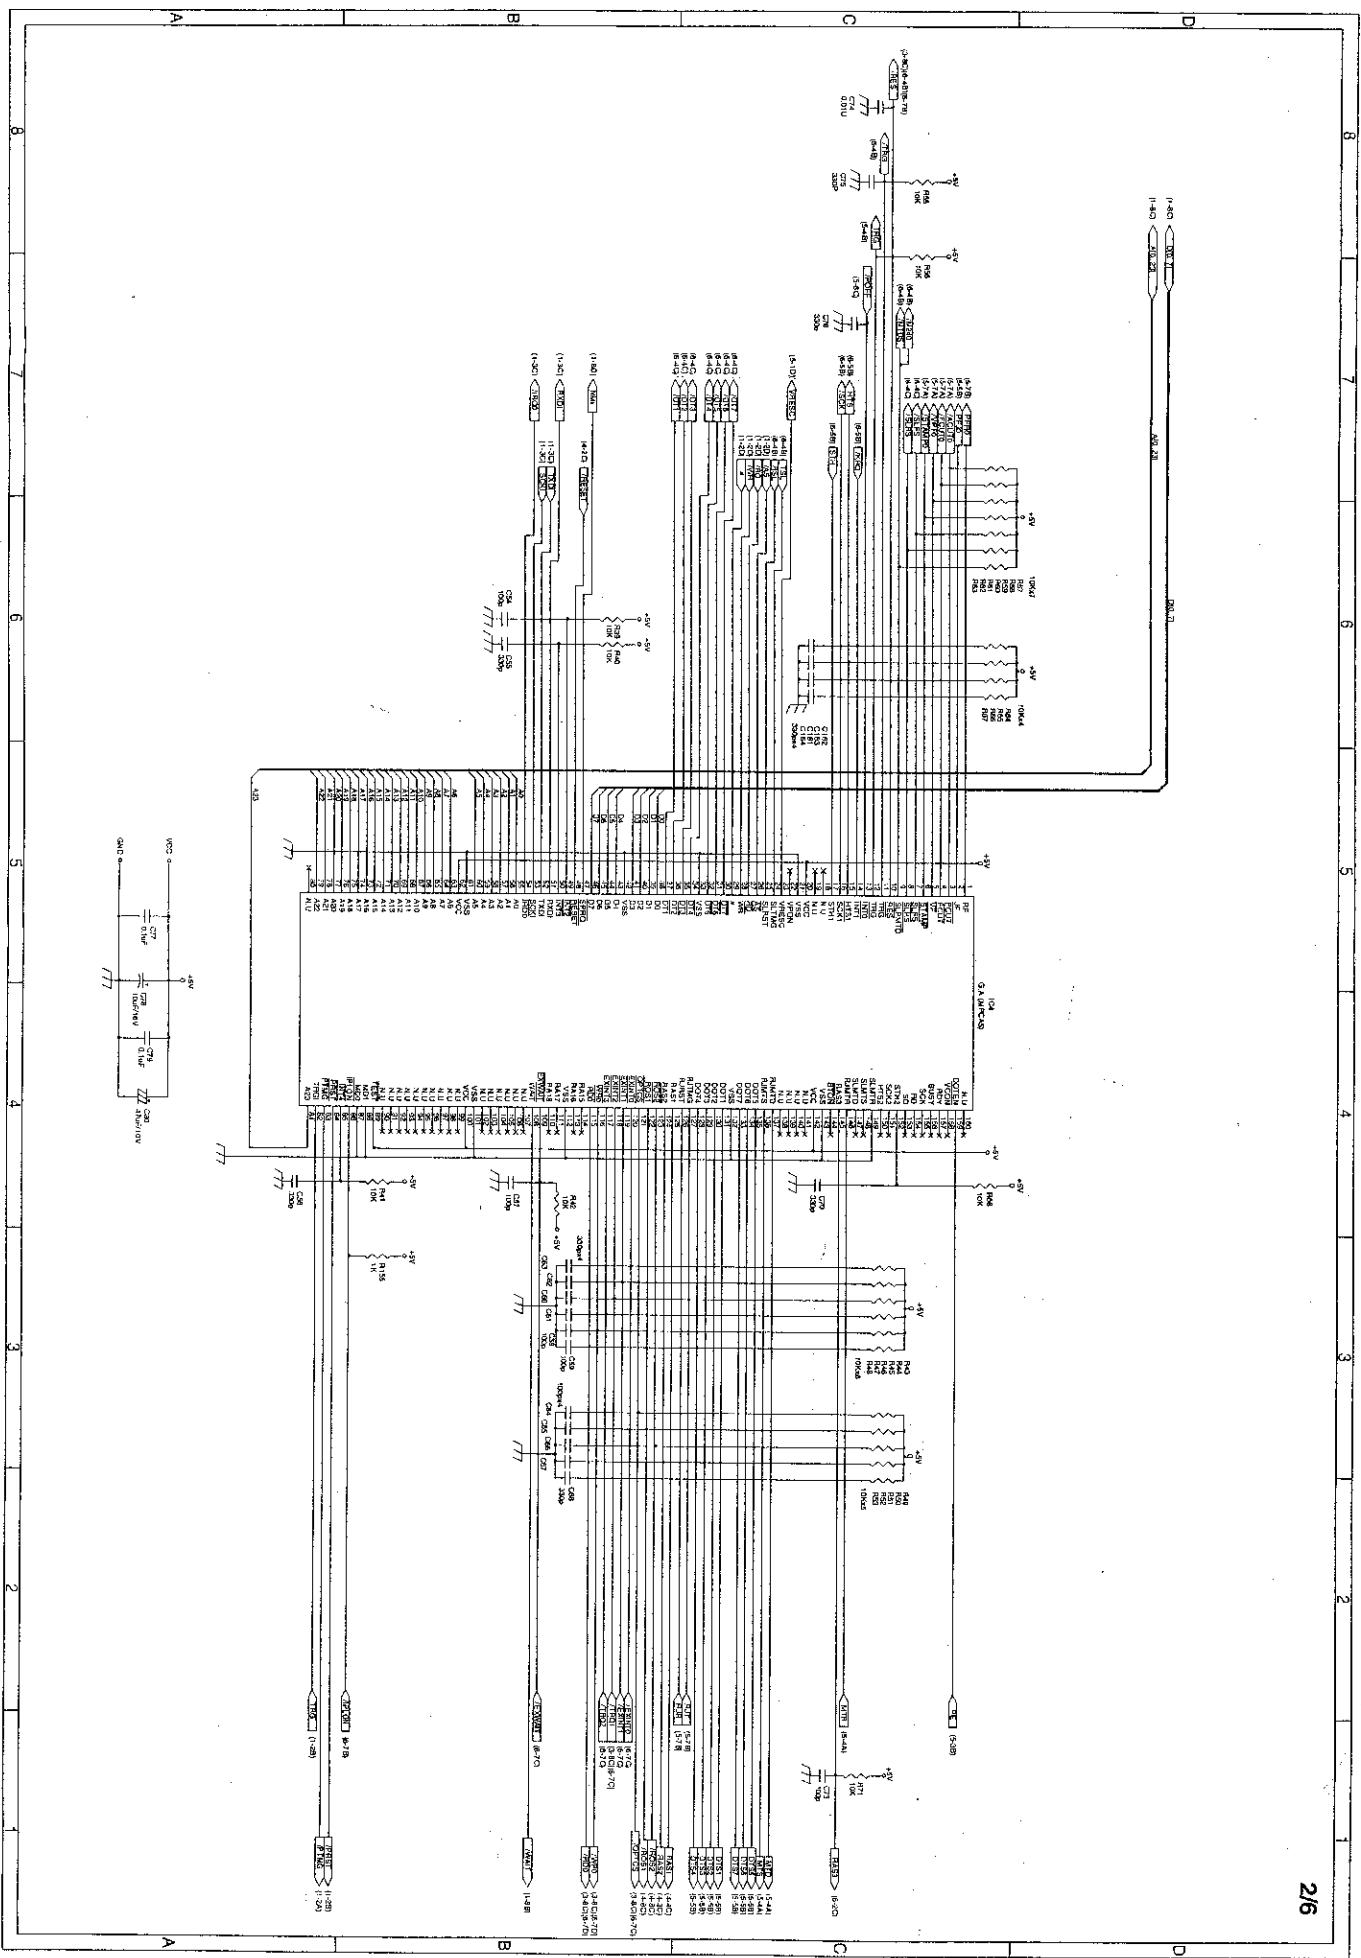

6. For the adjustment of printer dot pulse, refer to CHAPTER 5. TEST FUNCTION, Test No. 150.

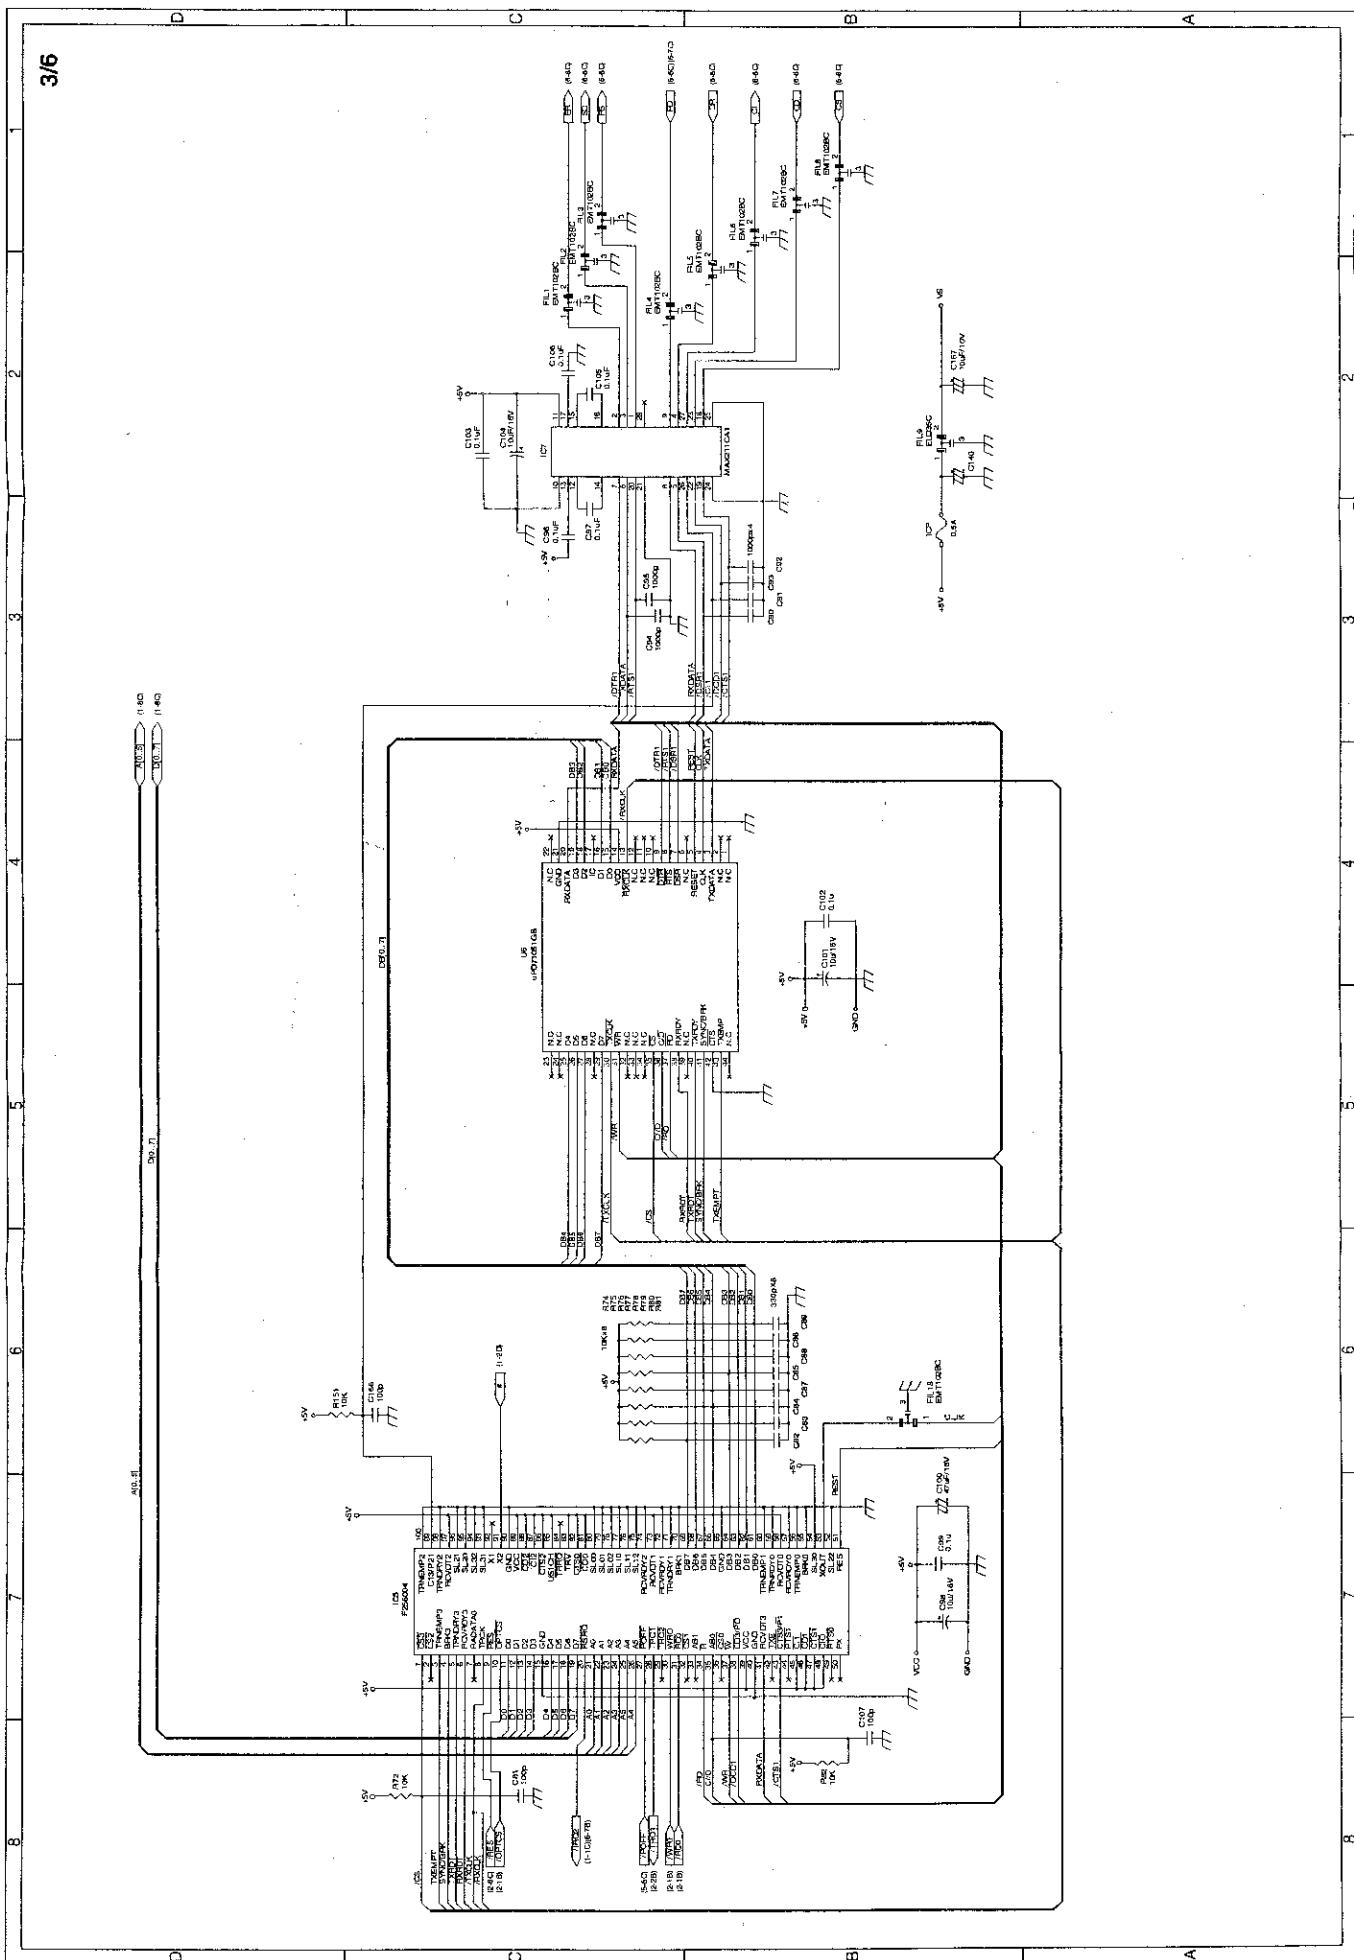

CHAPTER 8. CIRCUIT DIAGRAM & PWB LAYOUT
